Industrial Refrigeration Control Valves

Catalog C12

ENGINEERING YOUR SUCCESS.

Refrigerating Specialties Division

Parker Industrial's Refrigeration Group (*Refrigerating Specialties and HERRL*) is the premier valve and control supplier to the food and beverage industry.

We've been the world leader in industrial refrigeration for more than 96 years. Our engineering expertise, customer service and manufacturing excellence combine to create a product breadth that is second to none. Products include solenoid valves, pressure regulators, hand valves, liquid level controls, strainers, probes and more.

As the world's population grows, so does the need for large scale, refrigerated food preparation and storage facilities. Food warehouses, meat processing plants, fisheries, dairies, breweries, supermarkets, bottling companies and wineries all rely on Parker industrial refrigeration control valves and system solutions. Keeping industrial machinery cool so that it operates more efficiently, maintaining the freshness of produce during transportation, and preventing mines from flooding are just some of the unique applications of the products Parker offers.

Industrial Refrigeration Control Valves

Our comprehensive product line includes pressure regulators, refrigerant float switches, strainers, automatic flow regulators, solenoid valves, gas powered suction stop valves, check valves, safety relief valves and service valves for both ammonia and halocarbon refrigerants – all built to the highest quality standards recognized throughout the world for durability and reliability.

Product Engineering

Understanding the dynamics of industrial systems and how they affect valve performance is key in the highly specialized refrigeration industry. Innovation, reliability and decades of experience are at the heart of our success. Our superior in-house testing capabilities include a full working ammonia rig and a supermarket rack system.

Customer Service

Meeting global customer requirements is our highest priority. Our highly skilled service professionals have extensive valve operation and application knowledge. We provide the solutions our customers need, for their specific application, when they need it.

General Information

How to Use this Catalog

This catalog is specific for ammonia refrigeration, but other halocarbon refrigerant sizing tables are available. The catalog is organized by product group. For most sections the first page is an overview followed by product specifications, general information, application guide and selection tables to aid in selecting a specific product. Additional information, in the appendices, provide schematic flow diagrams for regulators, dimensional information on entire product line, valve torque specification and safety information.

Where cold ammonia liquid lines are used, it is necessary that certain precautions be taken to avoid damage that could result from trapped liquid expansion.

- Temperature increase in a valved off piping section completely full of liquid will cause high pressure due to the expanding liquid which can possibly rupture a gasket, pipe or valve.
- All hand valves isolating such sections should be marked, warning against accidental closing, and must not be closed until all liquid is removed.
- Check valves must never be installed upstream of solenoid valves, regulators with electric shut-off, nor should hand valves upstream of solenoid valves or downstream of check valves be closed until all liquid ammonia has been removed.
- It is advisable to install liquid relief devices suitable to safely and automatically bypass any trapped liquid ammonia to the low side of the system. This method is preferred since it operates automatically and requires little attention.
- Avoid all piping or control arrangements that might produce thermal or pressure shock. For the protection of people and products, all refrigerant must be removed from the section to be worked on before a valve, strainer, or other device is opened or removed. Flanges with ODS connections are not suitable for ammonia service.

SAFETY PRACTICES

People doing any work on a refrigeration system must be qualified and completely familiar with the system and the Refrigerating Specialties Division valves involved, or all other precautions will be meaningless. This includes reading and understanding pertinent Refrigerating Specialties Division product Bulletins and Safety Bulletin RSB prior to installation or servicing work.

WARNING: FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF REFRIGERATING SPECIALTIES DIVISION PRODUCTS, ASSEMBLIES OR RELATED ITEMS (“PRODUCTS”) CAN CAUSE DEATH, PERSONAL INJURY, AND PROPERTY DAMAGE. POSSIBLE CONSEQUENCES OF FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF THESE PRODUCTS INCLUDE BUT ARE NOT LIMITED TO:

- Injuries or damage resulting from inhalation or exposure to conveyed fluids
- Injuries from lifting or supporting a heavy item
- Electric shock from contact with live electrically energized components
- Explosion

Before selecting or using any of these Products, it is important that you read and follow the instructions below.

A4 Adaptomode® Series Pressure Regulators

The A4 family of regulators includes valves that control inlet, outlet or differential pressure. Each regulator is available with an assortment of additional variations which enable one regulator to perform several functions. The most common arrangements are shown on the following pages 6 - 7.

Specifications

Body: 20mm -100mm (¾" - 4")	Gray Iron (ASTM A126 Class B)
125mm - 200mm (5" - 8")	Cast Steel (A-352 GR, LCB)
Temperature Range: 20mm -100mm (¾" - 4")	-45°C - 105°C (-50°F - 220°F)
125mm - 200mm (5" - 8")	-50°C - 105°C (-60°F - 220°F)
Maximum Rated Pressure (MRP)	27.6 barg (400 psig)
Maximum Operating Pressure Difference (S Features Only)	20.7 bard (300 psid)

DIN Specifications

Body: 20mm - 100mm (¾" - 4")	Ductile Iron (DIN GGG 40.3)
Temperature Range: 20mm -100mm (¾" - 4")	-45°C - 105°C (-50°F - 220°F)
Maximum Rated Pressure (MRP)	28 barg (406 psig)
Maximum Operating Pressure Difference (S Features Only)	20.7 bard (300 psid)

Standard connection styles: FPT for 20mm - 50mm (¾" - 2"); SW for 65mm - 100mm (2½" - 4").
Standard size and style will be furnished unless specified otherwise.

① All 20mm (¾") plugs also fit in 25mm (1") valves.

② All 40mm (1⅝") plugs also fit in 50mm (2") valves.

A4 regulators with variations are factory assembled and tested.

Application Guide

There are many possible combinations of A4 regulator variations. The electric shut-off (S), electric wide-opening (B) and dual pressure (D) variations are often combined with each other. Or they may be used in combination with the compensated (M, P, 3P and T), outlet pressure (O) or differential pressure (L) regulators. Remote configurations of most variations are available using the A4R regulator separate from pilot controls.

The A4A Series flanged body regulators are available with 20mm - 100mm (3/4" - 4") ports.

The A4W Series weld end body regulators are available with 125mm - 200mm (5" - 8") ports.

Variation	Type Suffix	Type	Function	Operation	Typical Applications
Basic Regulator	—	A4A A4W	Control inlet pressure	Operates at present inlet pressure. Can be field adjusted. Opens on rising inlet pressure.	1. Evaporator pressure control 2. Condenser pressure control 3. Any inlet pressure control
Electric Shut-Off	S	A4AS A4WS	Control inlet pressure or shut off regulator	Regulates when electrically energized; closed when not energized.	1. Open for temperature control 2. Closed for defrosting
Electric Wide Opening	B	A4AB A4WB	Control inlet pressure or wide open regulator	Regulates when not electrically energized; wide open when energized.	1. Wide open for maximum cooling 2. Regulating for defrost 3. Regulating for temperature control.
Dual Pressure	D	A4AD A4WD	Dual pressure control	Regulates at lower pressure when electrically energized; at higher pressure when not energized.	1. Higher pressure for defrost 2. Higher pressure for temperature control. 3. Internal pressure relief.
Re-seating Relief	K	A4AK	Re-seating relief regulator	Open wide above set point. Repeatedly re-seats after operation.	1. Defrost relief 2. Non-atmospheric relief 3. High to low relief
Outlet Pressure Regulator	O	A4AO A4WOE	Control outlet pressure	Regulates at preset outlet pressure. Can be field adjusted. Opens on a drop in outlet pressure.	1. Crankcase pressure regulation 2. Hot gas bypass; booster loading 3. Receiver pressure control
Differential Pressure Regulator	L	A4AL	Control pressure difference across regulator	Regulates pressure difference at or below a pre-set amount.	1. Liquid pump relief regulator 2. Reduce liquid or vapor line pressure
Electrically Compensated	M	A4AM A4WM	Motor changes pressure set-point	Potentiometer or solid state type thermostat readjusts set-point to match evaporator temperature to a varying load.	1. Precise control of process cooling 2. Liquid chillers 3. For load change compensation
Pneumatically Compensated	P 3P	A4AP A4WP A4A3P A4W3P	Air pressure changes set-point (1:1 ratio); A4A3P for 3:1 ratio	Pneumatic thermostat readjusts set-point to match evaporator temperature to a varying load.	1. Precise control of process cooling 2. Liquid chillers 3. For load change compensation
Electronic Pilot Operated	J	A4AJ	Electronic signal controls regulator opening	Pilot position is proportional to electronic signal.	1. Precise control 2. Liquid chiller 3. System with load change
Externally Equalized	E	A4AE A4AOE A4AOES	Control at external pressure sensed remote from valve	Same as standard regulator except controlled pressure is sensed away from regulator.	1. Low Pressure drop (A4AE) 2. Hot gas bypass (A4AOE)
Main regulator for Remote Pilot	R	A4AR A4WR	Main regulator is controlled by separate pilots	Main regulator modulates, closes or opens in response to remote pilots.	1. Simple inventory of regulator and pilots 2. Convenient placement of pilots 3. Unusual pilots or circuits
Basic Regulator Assembly	Z	A4AZ	Complete regulator assembly to which modules can be added.	Can be built into most of the A4A variation regulators. Has a Modudapter® and two Moduplates®.	Versatile unit for inventory along with Adaptomode Modules sold separately.

These are the most common variations of the type A4 regulator. For other combinations, please consult factory.

A4 Adaptomode® Series Pressure Regulators

Moduadapter® (MD, SMD)

The special adapter to which the modular solenoid pilot, modular pressure pilot and Moduplate are bolted.

The Series Moduadapter (SMD) is used with special regulators such as A4ADS, A4ABDS, etc. and with all A4W regulators.

Furnished with bolts and gaskets. (Standard part of regulators with S, B, D and Z variations)

Port Sizes:

- MD25: 20mm - 25mm (3/4" - 1")
- MD32: 32mm (1 1/4")
- MD50: 40mm - 50mm (1 5/8" to 2")
- MD65: 65mm (2 1/2")
- MD75: 75mm (3")
- MD100: 100mm (4")
- SMD65: 20mm - 65mm (3/4" - 2 1/2") and 125mm - 200mm (5" - 8")
- SMD100: 75mm - 100mm (3" - 4")

A2D Modular Pressure Pilot

Adds dual (D) variation when combined with Modular Solenoid Pilot. Provides a second higher control pressure.

Furnished with bolts and O-rings. Mounts to Moduadapter®.

Port Sizes:

- Use A2D2 with 20mm - 25mm (3/4" - 1")
- Use A2D with 65mm - 200mm (2 1/2" - 8")
- Range A:** (standard)
0.35 barg - 10 barg (5 psig - 150 psig)
- Range D:**
5.2 barg - 19.3 barg (75 psig - 280 psig)

Outlet Regulator Kit (OR)

An auxiliary adapter which converts A4A inlet regulators to outlet regulators with OE variation.

Furnished with all internal parts, bolts and gaskets.

Port Sizes:

- OR50 for 20mm - 50mm (3/4" - 2")
- OR200 for 65mm - 200mm (2 1/2" - 8")

Pressure Bonnet Kit (PK)

Converts any A4, A4O or A2 Series regulator to 1:1 Pressure Compensation (P) variation. Standard in A range. Use with Type VC vacuum cartridge for V range.

Also available 3:1 pressure compensation (3P) variation. Furnished with 1/4" FPT bonnet connection for air or refrigerant pressure, bolts and gaskets. 3:1 kit includes above plus auxiliary adapter.

Same for all port sizes.

Type:

- PK1** for 1:1 ratio.
- PK3** for 3:1 ratio

Moduplate® (MP)

Provides blank off or cross-over of pilot circuit on Type A4S or Type A4B.

Attaches to Moduadapter. Same for all regulator sizes.

Furnished with bolts and three O-rings.

Motor Bonnet Kit (MB)

Converts to electric compensation (M) variation any A4 Series regulator. Standard in A range. Combine with VC vacuum cartridge for V range.

Furnished with bonnet, all internal parts, cam, bolts, gaskets, motor and transformer with 24 Volt secondary to operate motor. Same for all port sizes.

Vacuum Cartridge (VC)

A pilot seat with vacuum range cartridge. Will change A range A4, A2B or A2D to vacuum range:

500mm Hg - 8.3 barg (20" Hg - 120 psig)

Furnished with diaphragm and necessary gasket. Same for all regulator sizes.

A4 Adaptomode® Series Pressure Regulators

Pressure Setting Ranges

Code	Set Point Range	Approx. Pressure Change per Turn of Adjustment Screw	Factory Set Point (unless other wise specified)	Factory Set Point "T" (unless other wise specified)
A ①	0.35 - 10 barg (5 - 150 psig)	1.7 barg (25 psig)	2.8 barg (40 psig)	5.5 barg (80 psig)
V	500mm Hg - 8.3 barg (20 in Hg - 120 psig)	1.7 barg (25 psig)	1.0 barg (15 psig)	—
D	5.2 - 19.3 barg (75 - 280 psig)	3.7 barg (53 psig)	9.7 barg (140 psig)	9.7 barg (140 psig)

① Standard

For variations "K" and "BK", the set point is factory set and sealed. Standard set point for each range is shown in the table above. A custom setting may be specified.

Manual Opening and Pressure Adjusting Stem

Port Size		Manual Opening Stem		Pressure Adjusting Stem
mm	inch	Bypass Mode	Regulating Mode

Capacities for R717 are based on 30°C liquid. Capacities are maximum and have no reserve for excess loads. Capacities apply to any A4A or A4W regulator (or S4A and S4W) regardless of variation used.

Sub-cooled liquid: For each 5°C liquid is colder than base temperature, increase table valves 3% for R717.

① 0.034 bar pressure drop capacities apply only to regulators with LPD (low pressure drop) variation.

② The 20mm regulator is available with throttling plug capacities equivalent to approximately 50% and 17% of the ratings in the tables.

③ The 32mm, 40mm, and 65mm - 100mm are available with throttling plug capacities equivalent to approximately 35% of the ratings in the tables.

Note: For liquid overfeed applications (nominal 2:1 to 5:1 ratio), add 20% to the evaporator load and select a regulator based on this increased load value.

Capacities for R717 are based on 86°F liquid. Capacities are maximum and have no reserve for excess loads. Capacities apply to any A4A or A4W regulator (or S4A and S4W) regardless of variation used.

Sub-cooled liquid: For each 10°F liquid is colder than base temperature, increase table values 3% for R717.

① 0.5 psig pressure drop capacities apply only to regulators with LPD (low pressure drop) variation.

② The ¾" regulator is available with throttling plug capacities equivalent to approximately 50% and 17% of the ratings in the tables.

③ The 1¼", 1½", and 2½" - 4" regulators are available with throttling plug capacities equivalent to approximately 35% of the ratings in the tables.

Note: For liquid overfeed applications (nominal 2:1 to 5:1 ratio), add 20% to the evaporator load and select a regulator based on this increased load value.

Capacities for R22 are based on 40°C (100°F) liquid and 5°C (10°F) superheat entering the regulator. Capacities are maximum and have no reserve for excess loads. Capacities apply to any A4A or A4W regulator (or S4A and S4W) regardless of variation used.

Sub-cooled liquid: For each 5°C/10°F liquid is colder than base temperature, increase table valves 4% for R22.

① 0.034 bar (0.5 psig) pressure drop capacities apply only to regulators with LPD (low pressure drop) Variation.

② 20mm (¾") regulator is available with throttling plug capacities equivalent to approximately 50% and 17% of the ratings in the tables.

③ The 32mm (1¼"), 40mm (1½"), and 65mm - 100mm (2½" - 4") are available with throttling plug capacities equivalent to approximately 35% of the ratings in the tables.

Note: For liquid overfeed applications (nominal 2:1 to 5:1 ratio), add 20% to the evaporator load and select a regulator based on this increased load value.

Capacities for R404a are based on 40°C (100°F) liquid and 5°C (10°F) superheat entering the regulator. Capacities are maximum and have no reserve for excess loads. Capacities apply to any A4A or A4W regulator (or S4A and S4W) regardless of variation used.

Sub-cooled liquid: For each 5°C/10°F liquid is colder than base temperature, increase table valves 4% for R404a.

① 0.034 bar (0.5 psig) pressure drop capacities apply only to regulators with LPD (low pressure drop) Variation.

② 20mm (3/4") regulator is available with throttling plug capacities equivalent to approximately 50% and 17% of the ratings in the tables.

③ The 32mm (1 1/4"), 40mm (1 5/8"), and 65mm - 100mm (2 1/2" - 4") are available with throttling plug capacities equivalent to approximately 35% of the ratings in the tables.

Note: For liquid overfeed applications (nominal 2:1 to 5:1 ratio), add 20% to the evaporator load and select a regulator based on this increased load value.

Hot Gas Bypass Capacities - A4A0

(typical application: screw compressor oil feed control)

R-717 (KW)

Inlet Pressure	Outlet Pressure Range	Port Size						
		20mm [Ⓢ]	25mm	32mm	40mm	50mm	65mm	75mm
2.1 barg	0 - 45 cm Hg	120	160	290	550	810	1100	1600
10.3 barg	3.1 bar to 45 cm Hg	380	530	930	1800	2600	3700	5300

R-717 (TONS)

Inlet Pressure	Outlet Pressure Range	Port Size						
		³ / ₄ " [Ⓢ]	1"	1 ¹ / ₄ "	1 ⁵ / ₈ "	2"	2 ¹ / ₂ "	3"
30 psig	0 - 15 in Hg	34	47	82	160	230	330	470
150 psig	45 psi to 15 in Hg	110	150	270	510	760	1100	1500

Based on near saturated inlet gas and 11 bar (150 psig) ratings for 30°C (86°F) condensing, 2 bar (30 psig) ratings for -7°C (20°F) condensing. Correction no essential for other gas or liquid temperatures.

Ⓢ For capacities of larger regulators or other conditions, contact factory. Flow coefficients for all sizes are shown on page 5 and may be used for other flow calculation and for larger regulators.

R-22 (KW)

Condensing Temp (°C)	Discharge Temp (°C)	Port Size						
		20mm [Ⓢ]	25mm	32mm	40mm	50mm	65mm	75mm
30	80	120	200	350	570	1000	1400	1900
40	80	140	240	400	660	1200	1600	2200
45	80	160	260	440	720	1300	1700	2400
50	80	170	280	480	780	1400	1900	2600

R-22 (TONS)

Condensing Temp (°F)	Discharge Temp (°F)	Port Size						
		³ / ₄ " [Ⓢ]	1"	1 ¹ / ₄ "	1 ⁵ / ₈ "	2"	2 ¹ / ₂ "	3"
86	180	35	58	99	160	290	380	550
100	180	41	67	110	190	330	440	630
110	180	44	73	130	200	370	480	690
120	180	48	79	140	220	400	530	750

Capacities are average for the condensing temperatures and the corresponding discharge temperatures listed. Liquid temperature is the same as condensing temperature; evaporator temperature 5°C (40°F) or less. Use at other reasonable conditions usually requires no capacity correction.

Ⓢ The 20mm (³/₄" port size type A4A0 regulator is available with reduced throttling plug capacities equivalent to approximately 50% to 17% of the rating shown here.

Compact Pressure Regulators - A2

The A2 type pressure regulators are compact, direct diaphragm operated, for use with refrigerant liquid or vapor. The regulators are for use in systems where a small inlet or outlet pressure regulator is needed.

Specifications

Body Gray Iron (ASTM A126 Class B)
 Temperature Range -45°C to 105°C (-50°F to 220°F)
 Maximum Rated Pressure (MRP) 27.6 barg (400 psig)

DIN Specifications

Body Ductile Iron (DIN GGG 40.3)
 Temperature Range -45°C to 105°C (-50°F to 220°F)
 Maximum Rated Pressure (MRP) 28 barg (406 psig)

General Information

Type	Description	Flow Coefficient		Ranges Available ③	Connections Available ③	
		Kv	Cv		FPT, SW, WN	DIN Weld Neck
A2B	Small Capacity Back Pressure Regulator	0.43	0.5	V, A, D	1/4", 3/8", 1/2", 3/4"	13, 20
A2BK ①	Relief, Give pressure setting	0.34	0.4	A, D		
A2BP	Differential Regulator for ext. connection	0.43	0.5	A, D		
A2BM	Electrically Compensated	0.43	0.5	V, A, D		
A2A	Small Capacity Back Pressure Regulator	1.28	1.5	A, D	1/4", 3/8", 1/2", 3/4"	13, 20
A2BO1 ②	Small Capacity Outlet Pressure Regulator	0.09	0.1	V, D	1/4", 3/8", 1/2", 3/4"	13, 20
A2BO2 ②		0.17	0.2			
A2BO4 ②		0.43	0.5			
A2CK	Relief Regulator – Liquid Lines	0.97	1.14	D	1/4", 3/8", 1/2", 3/4"	13, 20

① The A2BK re-seating relief regulator can be used for various relief to low side applications including cold liquid line sections where buildup of dangerous hydrostatic pressure is possible. See "Safe Operation" on the back cover.

② Specify for external pressure connection.

③ Bold face type is standard size. FPT will be furnished unless specified otherwise.

Pressure Setting Ranges

Code	Set Point Range	Approx. Pressure Change per Turn of Adjustment Screw	Factory Set Point (unless other wise specified)
A ①	0.35 to 10 barg (5 to 150 psig)	1.7 barg (25 psig)	2.8 barg (40 psig)
V	500mm Hg to 8.3 barg (20 in Hg to 120 psig)	1.7 barg (25 psig)	1.0 barg (15 psig)
D	5.2 to 19.3 barg (75 to 280 psig)	3.7 barg (53 psig)	9.7 barg (140 psig)

① Standard

For variations "K" and "BK", the set point is factory set and sealed. Standard set point for each range is shown in the table above. A custom setting may be specified by adding the set point in PSIG preceded by "-" at the end of the model number. Set point must be valid for the range selected.

Application Guide

Type	Function	Operation	Typical Applications
A2B	Control inlet pressure	Regulate at preset inlet pressure	1. Small capacity back pressure regulator 2. Small capacity defrost relief regulator
A2A	Inlet regulator, greater capacity	Filed adjustable Open on rise in inlet pressure	
A2BO	Control outlet pressure	Regulate at preset outlet pressure Filed adjustable Open on drop in outlet pressure	1. Gas pressure reducing regulator 2. Liquid or oil pressure reducing regulator
A2CK ①	Relief Regulator	Regulate inlet pressure. Factory set	1. Prevent hydrostatic pressure build-up in isolated sections of liquid lines.

① The design of the A2CK valve allows for higher flow and a "quick release" feature. However, it does not offer the same type of controlled response which may be required for a standard regulator application. For those applications where a small regulator is needed for accurate upstream pressure control, and A2A or A2B direct operated regulator should be considered.

Compact Pressure Regulators - A2B, S6N

Function

One main regulator can be controlled by combinations of remote regulators and solenoids to provide a variety of functions. Because of the high cost of installation and the possibility of error in field remote piping, the A4A Series of self-contained regulators is preferred (see pages 5 - 9).

Applications

- Typical applications include:
- **Main regulator in an inaccessible location.** Pilot can be located where it can be adjusted and serviced conveniently.
 - **When better environment is required.** Remote pilots can solve electrical or pneumatic variation problems.

Typical Remote Combinations

Figure 1: The remote equivalent to a 75mm (3") Type A4AM would use a 75mm (3") A4AR main valve with a A2BM pilot regulator.

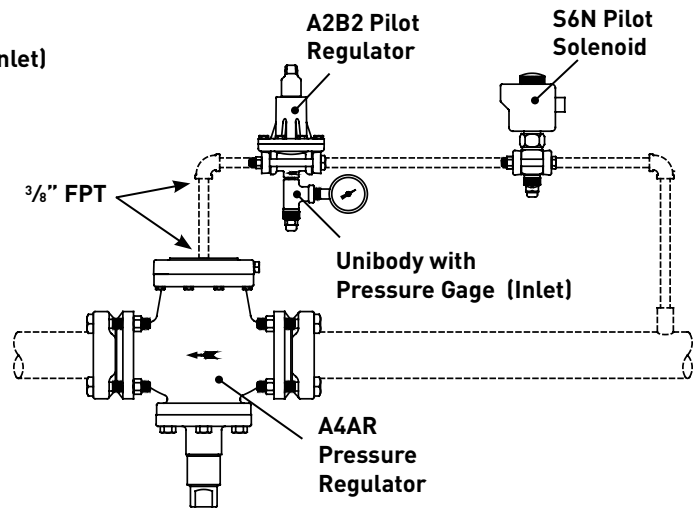

Figure 2: The remote equivalent to a 50mm (2") Type A4AS would use a 50mm (2") A4AR main valve with a A2B2 pilot regulator with an S6N pilot solenoid piped in series.

Any of the A4A or A4W regulators with or without added variations are available as a remote regulator by using an A4AR 20mm - 100mm (3/4" - 4") or A4WR 125mm - 200mm (5" - 8") main valve with the suitable pilots.

Type	Description	For use with Main Valve Size and Type	Ranges Available ①	Connections Available ①
				FPT, SW, WN
A2B2	Inlet Pressure Pilot Regulator	20mm - 50mm (3/4" - 2") A4AR	V, A, D	3/8", 1/2", 3/4"
A2B	Inlet Pressure Pilot Regulator	65mm - 100mm (2 1/2" - 4") A4AR 125mm - 200mm (5" - 8") A4WR		
A2BO2E	Outlet Pressure Pilot Regulator	20mm - 50mm (3/4" - 2") A4AR	V, D	3/8", 1/2", 3/4"
A2BO4E	Outlet Pressure Pilot Regulator	65mm - 100mm (2 1/2" - 4") A4AR 125mm - 200mm (5" - 8") A4WR		

① Bold face type is standard size. FPT will be furnished unless specified otherwise. All of the Pilot Regulators above are available as compensated controls. For Electrically Compensated, add suffix "M", as A2B2M; for Pneumatically Compensated, add suffix "P" or "3P", as A2B2P or A2B23P; for Temperature Compensated, add suffix "T", as A2BT. Temperature range and scale is - 30°C to 30°C (-20°F to 80°F).

Capacities for R717 are based on 30°C liquid. Capacities are maximum and have no reserve for excess loads. Capacities apply to any A4A or A4W regulator (or S4A and S4W) regardless of variation used.

Sub-cooled liquid: For each 5°C/10°F liquid is colder than base temperature, increase table valves 3% for R717.

Note: For liquid overfeed applications (nominal 2:1 to 5:1 ratio), add 20% to the evaporator load and select a regulator based on this increased load value.

Capacities for R134a are based on 40°C (100°F) liquid and 5°C (10°F) superheat entering the regulator. Capacities are maximum and have no reserve for excess loads. Capacities apply to any A4A or A4W regulator (or S4A and S4W) regardless of variation used.

Sub-cooled liquid: For each 5°C/10°F liquid is colder than base temperature, increase table values 4% for R134a.

Note: For liquid overfeed applications (nominal 2:1 to 5:1 ratio), add 20% to the evaporator load and select a regulator based on this increased load value.

Capacities for R507a are based on 40°C (100°F) liquid and 5°C (10°F) superheat entering the regulator. Capacities are maximum and have no reserve for excess loads. Capacities apply to any A4A or A4W regulator (or S4A and S4W) regardless of variation used.

Sub-cooled liquid: For each 5°C/10°F liquid is colder than base temperature, increase table values 4% for R507a.

Note: For liquid overfeed applications (nominal 2:1 to 5:1 ratio), add 20% to the evaporator load and select a regulator based on this increased load value.

Capacities are based on -18°C (0°F) liquid ammonia and no flash gas.

For evaporator temperatures between 4°C to -40°C (40°F to -40°F), capacities are within 5%.

Correction factors for temperatures between -40°C (-40°F) and 30°C (86°F) are negligible.

Solenoid Valves

The solenoid valves include direct operated and pilot operated valves. Selections for most refrigeration applications are available – liquid, suction, hot gas and compressor unloading. Low or no pressure differential, equalizing and vent solenoid in sizes up to 50mm (2”).

Explosion proof SV2X and S4X hazardous environment type solenoids carry NEMA Type 4 and 7 classification.

Specifications

Maximum Opening Pressure Difference (MOPD) .. 20.7 barg (300 psig)
 Maximum Rated Pressure (MRP) 27.6 barg (400 psig)
 SV2 only 31.0 barg (450 psig)

DIN Specifications

Maximum Opening Pressure Difference (MOPD) ... 20.7 barg (300 psig)
 Maximum Rated Pressure (MRP) 28 barg (406 psig)

All capacities are maximum for the conditions listed and have no reserve for excess loads.

- ① R717 capacities are based on -7°C liquid with no flashing, -15°C evaporator temperature and no liquid overfeed. For liquid overfeed, multiply evaporator KW by recirculating rate and size valve to the KW result. Use of -7°C liquid for capacities in this table is sufficiently accurate for most liquid overfeed systems. To convert for 30°C input, multiply values in the table by 0.9.
- ② R717 capacities are based on 30°C condensing temperature and the evaporator temperatures listed. See A4A suction capacities on page **10** for other pressure drops and for corrections for liquid overfeed and sub-cooled liquid.
- ③ Hot gas heat reclaim capacities are in terms of heat of condensation rejected at the condenser and are based on saturated inlet conditions at pressures equivalent to the condensing temperatures and for the pressure drops listed.
- ④ The 20mm port size S4A is available with capacities equal to 50% of the ratings shown.
- ⑤ CK-2 and S9A. See page **49** and **52** for low pressure drop at temperatures below -10°C.

All capacities are maximum for the conditions listed and have no reserve for excess loads.

① R717 capacities are based on 20°F liquid with no flashing, 5°F evaporator temperature and no liquid overfeed. For liquid overfeed, multiply evaporator ton by recirculating rate and size valve to the ton result. Use of 20°F liquid for capacities in this table is sufficiently accurate for most liquid overfeed systems. To convert for 86°F input, multiply values in the table by 0.9.

② R717 capacities are based on 86°F condensing temperature and the evaporator temperatures listed. See A4A suction capacities on page **11** for other pressure drops and for corrections for liquid overfeed and sub-cooled liquid.

③ Hot gas heat reclaim capacities are in terms of heat of condensation rejected at the condenser and are based on saturated inlet conditions at pressures equivalent to the condensing temperatures and for the pressure drops listed.

④ The 3/4" port size S4A is available with capacities equal to 50% of the ratings shown.

⑤ CK-2 and S9A. See page **49** and **52** for low pressure drop at temperatures below 14°F.

All capacities are maximum for the conditions listed and have no reserve for excess loads.

- ① Liquid capacities for R22 are based on 40°C condensing and 5°C evaporator temperatures with no flashing through the valve for the pressure drops listed. For each 5°C liquid is below 40°C, INCREASE values by 5%.
- ② Suction capacities for R22 are based on 40°C liquid and 5°C superheat entering the valve at the pressure drops and evaporator temperatures listed. For each 5°C liquid is below 40°C, INCREASE values by 5%.
- ③ Hot gas heat reclaim capacities are in terms of heat of condensation rejected at the condenser and are based on saturated inlet conditions at pressures equivalent to the condensing temperatures and for the pressure drops listed.
- ④ The 20mm port size S4A is available with capacities equal to 50% of the ratings shown.

All capacities are maximum for the conditions listed and have no reserve for excess loads.

① Liquid capacities for R404a are based on 100°F condensing and 40°F evaporator temperatures with no flashing through the valve for the pressure drops listed. For each 40°F liquid is below 100°F, INCREASE values by 5%.

② Suction capacities for R404a are based on 100°F liquid and 40°F superheat entering the valve at the pressure drops and evaporator temperatures listed. For each 10°F liquid is below 100°F, INCREASE values by 5%.

③ Hot gas heat reclaim capacities are in terms of heat of condensation rejected at the condenser and are based on saturated inlet conditions at pressures equivalent to the condensing temperatures and for the pressure drops listed.

④ The 3/4" port size S4A is available with capacities equal to 50% of the ratings shown.

Gas Powered Valves

The CK-2 and CK-5, normally open, gas powered suction stop valves are uniquely constructed to use discharge pressure to close. These valves are typically used for low temperature applications in wet return lines on liquid recirculation systems or on the liquid and gas return legs of flooded evaporators. Due to its normally open construction, pressure drop is minimal in suction or wet return applications. In addition, normal gravity circulation is unrestricted on flooded evaporators. For gravity flooded evaporators, both valves should be installed with their flow arrows pointing towards the surge drum. Being pressure powered to close, this valve can overcome sticking at low temperatures caused by the presence of viscous oil.

Unlike the CK-2, the CK-5 is designed to remain in a closed position in the event that power to the pilot solenoid is inadvertently interrupted (i.e. a power failure), during hot gas defrost. This prevents a “suction shock” condition under these circumstances.

The S9A, normally closed, gas powered suction stop valve is a pilot operated valve but uses an external source of higher pressure gas to operate the valve, and, therefore requires no minimum pressure drop to open. The external gas pressure for the Type S9A must be at least 0.69 bar (10 psi) above valve internal upstream pressure for positive opening. This valve is normally closed.

The S9A valve is designed to promptly and fully open or close under conditions which make conventional solenoid valves unreliable or unsuitable, such as viscous oil conditions, location in a vertical pipeline, or where very low valve pressure drop is required. This valve is a two-position valve using condenser gas pressure acting upon a piston for opening, and a strong spring for closing. A twin pilot solenoid valve assembly (S9) serves to admit condenser gas pressure to the piston for opening and to bleed this gas pressure to the suction line for valve closing.

Specifications

Temperature Range -50°C to 105°C (-60°F to 220°F)
 Maximum Rated Pressure (MRP) 27.6 barg (400 psig)

DIN Specifications

Temperature Range -50°C to 105°C (-60°F to 220°F)
 Maximum Rated Pressure (MRP) 28 barg (406 psig)

Capacities are based on liquid temperatures equal to evaporator temperatures. For liquid overfeed systems, nominal 2:1 to 5:1 ratio, add 20% to the evaporator load and select a valve based on the increased load.

① The CK2 may be used at these temperatures if it is powered by nearly oil free hot gas (such as in rotary screw compressor systems). If the gas is not nearly oil free, use the CK2 only at temperatures above -30°C (-25°F).

Capacities are nominal and are based on accepted industry practice concerning surge drum height and evaporator geometry.

Dual Position Control Valves

Designed to eliminate the damaging effects of hydraulic shock caused by liquid deceleration, vapor propelled liquid slugs, and condensation induced hydraulic shock, the S4AD, CK-2D, and CK-6D combine the features of hot gas/soft gas valve configurations and suction stop with equalization valve configurations. The S4AD can additionally be used for high pressure liquid make up applications to prevent liquid hammer, replacing parallel liquid line solenoid valves.

The CK-2D and CK-6D are low pressure drop, gas powered suction stop valves, for low temperature ammonia, approved CFC, HCFC, or HFC refrigerants and corresponding approved refrigerant oils or fluids. The CK-2D is a normally open valve, which uses discharge gas to power the valve closed. The CK-6D incorporates a fail safe feature, which holds the valve in the equalizing position until a safe coil pressure is reached, should a power failure occur during the defrost cycle.

The valve position is controlled via the sequencing of two integral pilot solenoids and can be held in a closed, partially

open (approximately 10% of full flow) or fully open position. By sequencing the solenoids based on time, users have the flexibility to set each stage to meet their specific needs.

Use solenoid capacity tables on pages **35 - 46** for the S4AD valve and gas powered capacity tables on pages **49 - 54** for the CK-2D and CK-6D valves.

Specifications

Temperature Range -50°C to 105°C (-60°F to 220°F)
 Maximum Rated Pressure (MRP) 27.6 bar (400 psig)

DIN Specifications

Temperature Range -50°C to 105°C (-60°F to 220°F)
 Maximum Rated Pressure (MRP) 28 bar (406 psig)

Coils

S6A Modular Solenoid Pilot

Adds electric shut-off (S) or electric wide opening (B) and is used with Modular Pressure Pilot A2D/A2D2 for dual (D) variations. Class "F" U.L. approved system with housing meeting 3R and 4 requirements.

Furnished with bolts and O-rings. Mounts to Moduadapter®. Same for all regulator sizes.

24 DC	Brown	White	6.70	6.70	-	204 (400)

Notes: LED knobs can only be used on AC coils.

S6B Compact Modular Solenoid Pilot

The S6B, Class "H" coil, is an optional pilot solenoid which can be mounted on the CK-5 gas powered suction stop valve, CK-2D and CK-6D dual position gas powered suction stop valves. Due to the "spring assisted" construction of the valve's plunger assembly allow the valves to be mounted on its side as opposed to the S6A, which must be mounted in a vertical position for the pilot solenoid to positively close when de-energized.

The supply circuits must be properly sized to give adequate voltage at the coil leads even when other electrical equipment is operating. The coil is designed to operate at 15% under voltage. Operating with line voltage below the limit will result in lowering the valve opening pressure differential.

S6B Voltage Availability

110-120V 50-60Hz, 220-240V 50-60Hz, 208V 60Hz, 240V 50Hz, and 24V 60Hz

Coils

Coils

SV2 Compact Modular Solenoid Pilot

These water resistant Class “H” solenoid coil is designed for long life and powerful opening force. The solenoid coil must be connected to electrical lines with Volts and Hertz the same as specified on the coil assembly. The supply circuits must be properly sized to give adequate voltage at the coil leads even when other electrical equipment is operating. The coil is designed to operate at 15% under voltage. Operating with line voltage below the limit will result in lowering the valve opening pressure differential.

Coil Type	Watts	Inrush Current (Amps)	Running Current (Amps)	Temp °C (°F)
Standard AC Coil - Class 'H'	10.5	37	23	180 (365)

SV2 Coil Voltage Availability

110-120V 50-60Hz, 220-240V 50-60Hz, 208V 60Hz, 240V 50Hz, and 24V 60Hz

Coils are available from stock with most standard voltages; see table above.
 Non-standard voltages; shown in the shaded area of table.
 Consult factory for other voltages.

- These voltages for the Class “H” coils are 120/60 - 110/50, 240/60 - 220/50, 480/60 - 440/50.

Notes: Remote pilot lights cannot be used with explosion proof or unleaded coils.
 Consult factory for information on explosion proof coils.

Check Valves (CK-1)

These piston type, gravity closing, heavy duty check valves prevent backward flow of fluid in refrigerant suction, hot gas or liquid lines. They are recommended for compressor discharge lines, also for liquid lines and suction lines.

The check valve opens by the pressure difference between valve inlet and outlet. The pressure difference must be a minimum of 0.03 bar (0.5 psi).

Specifications

Port Sizes	20mm to 150mm (¾" to 6")
Temperature Range	-30°C to 105°C (-25°F to 220°F)
Maximum Rated Pressure (MRP)	27.6 barg (400 psig)

① Liquid Line Capacities

R717 is based on -7°C (20°F) liquid and -18°C (0°F) evaporator temperatures. To correct for 30°C (86°F) liquid, multiply capacities by 0.9.

R22 is based on -7°C (20°F) liquid and -7°C (20°F) evaporator temperatures. For each 5°C/10°F liquid is below -7°C (20°F), increase capacities by 3%.

② Hot Gas Discharge Capacities

R717 is based on 30°C (86°F) condensing and -20°C (0°F) evaporator temperatures. Use at other typical conditions normally requires no capacity correction.

R22 is based on 38°C (100°F) condensing and -7°C (20°F) evaporator temperatures.

③ Liquid Capacities

R717 is based on -7°C (20°F) liquid temperature and 0.051 bar (0.75 psi) pressure drop.

R22 is based on 38°C (100°F) liquid temperature and 0.051 bar (0.75 psi) pressure drop.

Correction factors for temperatures between -40°C (-40°F) and 30°C (86°F) are negligible.

Suction Line Capacities

CK-1 suction line capacities are the same as the values for the CK-2 valves at 0.034 bar (0.5 psi) pressure drop. Refer to the CK-2 tables on page 49.

① **Liquid Line Capacities**

R410a is based on -7°C (20°F) liquid and -7°C (20°F) evaporator temperatures. For each 5°C/10°F liquid is below -7°C (20°F), increase capacities by 3.5%. R507a is based on -7°C (20°F) liquid and -7°C (20°F) evaporator temperatures. For each 5°C/10°F liquid is below -7°C (20°F), increase capacities by 4.0%.

② **Hot Gas Discharge Capacities**

R410a and R507a are based on 38°C (100°F) condensing and -7°C (20°F) evaporator temperatures.

③ **Liquid Capacities**

R410a and R507a are based on 38°C (100°F) liquid temperature and 0.051 bar (0.75 psi) pressure drop. Correction factors for temperatures between -40°C (-48°F) and 30°C (86°F) are negligible.

Suction Line Capacities

CK-1 suction line capacities are the same as the values for the CK-2 valves at 0.034 bar (0.5 psi) pressure drop. Refer to the CK-2 tables on page 51.

Check Valves

Check Valves (CK-3)

The in-line CK-3 check valve prevents backward flow of high pressure refrigerant gases and liquid. The PTFE valve seat and stainless steel body allows the CK-3 to withstand corrosive environments associated in industrial refrigeration conditions.

The spring loaded check valve requires a minimum 0.34 bar (5 psi) pressure drop to overcome the spring force and lift the valve seat, allowing the check valve to be mounted in any position. The valve opens wide for flow in the arrow direction on the body of the valve. When flow reversal occurs the CK-3 valve closes quickly and reliably.

Specifications

Temperature Range	-30°C to 105°C (-25°F to 220°F)
Maximum Rated Pressure (MRP)	27.6 bar (400 psig)
Body	Stainless Steel
Seat	PTFE
Minimum Pressure Drop	0.34 barg (5.0 psig)

General Information

Port Size		Flow Coefficient		Connections Available
mm	inch	Kv	Cv	FPT
13	1/2	8.1	9.5	1/2"
20	3/4	9.0	10.5	3/4"
25	1	9.8	11.5	1"

For more information see bulletin 50-13.

Application Guide

Port Size		Operation	Mounting
mm	inch		
13 - 25	1/2 - 1	1. Hot gas lines from pan to evaporator 2. Liquid lines	Any position

Check Valves

In-Line Check Valves (CK4A)

The in-line CK4A check valves prevent backward flow of fluid in refrigerant suction, hot gas or liquid lines. The primary use for these valves is in discharge and suction lines of screw compressor systems. They are also suited for high speed piston compressor discharge and for compressor suctions

Specifications

Port Sizes	13mm to 200mm (1/2" to 8")
Temperature Range	-50°C to 105°C (-60°F to 220°F)
Maximum Rated Pressure (MRP)	34.5 barg (500 psig)
Body: 13mm (1/2")	Cast Steel
20mm - 200mm (3/4" - 8")	Cast Steel (A-352 GR, LCB)
Pressure Drop: 13mm - 100mm (1/2" - 4")	0.05 barg (0.75 psig)
125mm - 200mm (5" - 8")	0.04 barg (0.60 psig)
Operation	Spring Closing

DIN Specifications

Port Sizes	13mm to 100mm (1/2" to 4")
Temperature Range	-50°C to 105°C (-60°F to 220°F)
Maximum Rated Pressure (MRP)	34.5 barg (500 psig)
Body	Ductile Iron (GGG-40.3)
Pressure Drop: 13mm - 100mm (1/2" - 4")	0.05 barg (0.75 psig)
125mm - 200mm (5" - 8")	0.04 barg (0.60 psig)
Operation	Spring Closing

Close coupling, valves sizes through 100mm (4"), using male adapter ring to outlet of R/S control valves.
 For more information see bulletin 50-16 for valve types CK4A-2 to CK4A-16 and 50-20 for valve types CK4A-20 to CK4A-32.

Application Guide

Port Size		Operation	Mounting
mm	inch		
13 - 200	1/2 - 8	1. Liquid lines 2. High speed compressor discharge lines (Not recommended for slow speed compressor discharge lines) 3. Pump discharge lines 4. Suction lines down to -55°C (-60°F) 5. Hot gas lines from pan to evaporator 6. Defrost relief regulator venting to an intermediate pressure 7. Prevent receiver pressure from backing up into a cold condenser 8. Prevent liquid returning to compressor during shutdown 9. Prevent liquid from flowing down into drain pan 10. Prevent reverse flow in suction line due to unusual load conditions	Any position Note: not recommended for side port applications on screw compressors

① Liquid Line Capacities

R134a is based on -7°C (20°F) liquid and -7°C (20°F) evaporator temperatures. For each 5°C/10°F liquid is below -7°C (20°F), increase capacities by 3.5%. R404a is based on -7°C (20°F) liquid and -7°C (20°F) evaporator temperatures. For each 5°C/10°F liquid is below -7°C (20°F), increase capacities by 4.0%.

② Hot Gas Discharge Capacities

R134a and R404a are based on 38°C (100°F) condensing and -7°C (20°F) evaporator temperatures.

③ Suction Line Capacities

R134a and R404a are based on 38°C (100°F) liquid and -7°C (20°F) evaporator temperatures and 0.052 bar (0.75 psi) pressure drop.

④ Liquid Capacities

R134a and R404a are based on 38°C (100°F) liquid temperature and 0.051 bar (0.75 psi) pressure drop. Correction factors for temperatures between -40°C (-48°F) and 30°C (86°F) are negligible.

Check Valves

Strainers

The RSF/RSW refrigerant strainers collect foreign materials and dirt in a refrigerant system at minimal pressure drop in order to minimize damage to or prevent malfunction of control valves. This, of course, is extremely important upon start-up of a new refrigeration system where dirt, scale, and weld particles may be present in the system and are disturbed and circulated when pressure testing or upon system start-up. Also when an existing system is revised, any settled dirt or foreign matter may be disturbed and circulated throughout the system.

The fine stainless screen mesh will collect particles as small as 0.009" in diameter (60 mesh @ 0.0075" wire). Generous available screen area allows maximum dirt capacity at minimum pressure drop. The strainers may be close coupled to Refrigerating Specialties valves having the same flange gasket size.

Specifications

- Port Sizes 13mm to 200mm (1/2" to 8")
- Temperature Range -50°C to 105°C (-60°F to 220°F)
- Maximum Rated Pressure (MRP) 27.6 barg (400 psig)
- Body: 13mm -100mm (1/2" - 4") Gray Iron (ASTM A126 Class B)
- 125mm - 200mm (5" - 8") Cast Steel (A-352 GR, LCB)
- Screen (60 Mesh) Stainless Steel

DIN Specifications

- Port Sizes 13mm to 125mm (1/2" to 5")
- Temperature Range -50°C to 105°C (-60°F to 220°F)
- Maximum Rated Pressure (MRP) 28 barg (406 psig)
- Body Ductile Iron (GGG40.3)
- Screen (60 Mesh) Stainless Steel

For more information see bulletin 00-10 for valve type RSF and 00-12 for valve types RSW.

Strainers

Flanges

These forged flanges are used to connect two pieces of pipe or valve onto a line. In order to meet our customer needs they come in different connection types and sizes. For proper flange gasket sealing, care must be taken when threading or welding to assure flanges are parallel to each other and perpendicular to the pipe. Gaskets should be lightly oiled and all bolts must be tightened evenly.

Standard Flange Specifications

Material: 13mm - 150mm (1/2" - 6") Forged Steel and conform to ASTM A105
 Temperature Range: 13mm - 100mm (1/2" - 4") -45°C - 105°C (-50°F - 220°F)
 125mm - 200mm (5" - 8") -50°C - 105°C (-60°F - 220°F)
 Maximum Rated Pressure (MRP) 28 barg (406 psig)
 Gasket Material: 13mm - 200mm (1/2" - 8") Garlock 2930

Stainless Steel Flange Specifications

Material: 13mm (1/2") 304SS ASTM A314
 Temperature Range: 13mm (1/2") -45°C - 105°C (-50°F - 220°F)
 Maximum Rated Pressure (MRP) 28 barg (406 psig)
 Gasket Material: 13mm (1/2") Garlock 2930

Two Bolt Flanges
Valve Port Sizes:
13mm - 100mm (1/2" - 1")

Flanges Unions

The flange union kits are used to combine a male and a female flange within the same flange size code. Union kits are available for flange sizes up to 100mm (4").

The kits consists of a flange gasket and the appropriate bolts for the flange size.

**Two Bolt Flange
Threaded (FPT)**

**Four Bolt Flange
Socket Weld/Outside
Diameter Sweat (SW/ODS)**

**Four Bolt Flange
Weld Neck (WN)**

For proper flange gasket sealing, care must be taken when threading or welding to assure flanges are parallel to each other and perpendicular to the pipe. Gasket should be lightly oiled and all bolts must be tightened evenly.

Adapter Rings

Adaptor rings are furnished with two matching flange gaskets.

Male Adapter Rings (MAR)

Are used to close couple CK4A or CK-1 check valves to the outlet of Refrigerating Specialties Control Valves.

Female Adapter Rings (FAR)

Are used in unions of two male flanges.

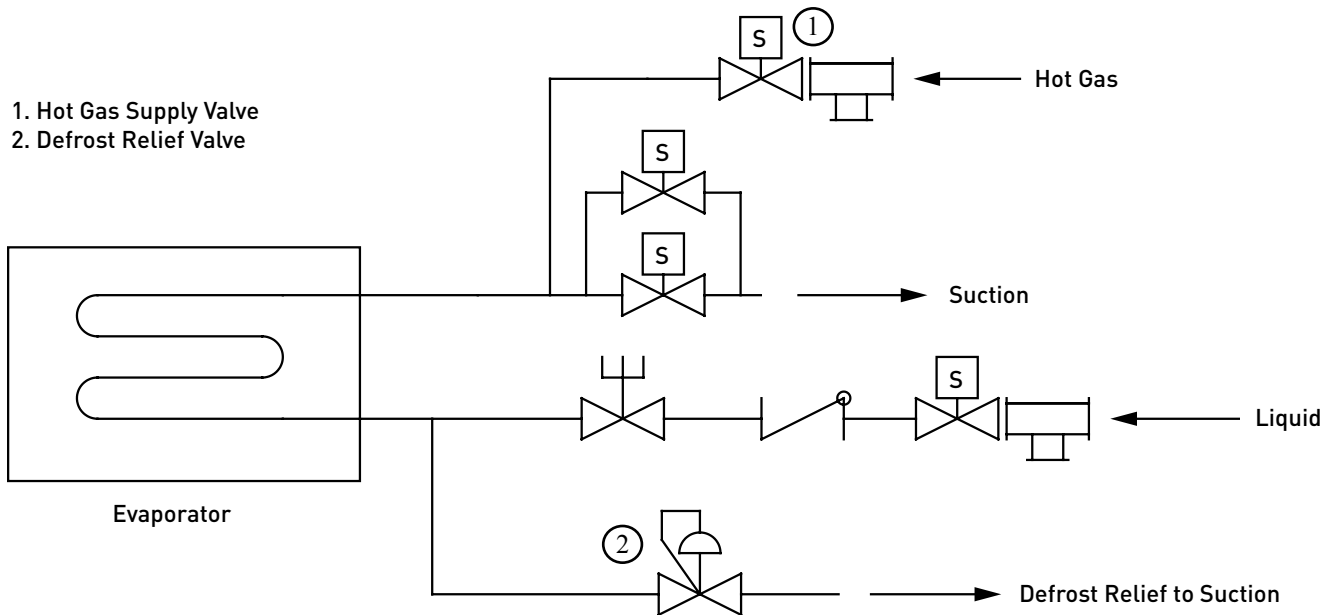

Male Adaptor Ring

Female Adaptor Ring

Hot Gas Defrost Valve Group

R-717 (KW)

50	S4A, A4AOS	50	A4AK	640	570	460	390	330

Notes:

Nominal capacities listed are based on normal defrost times saturated hot gas inlet to valve no less than 30°C (86°F), a 5°C/10°F difference between evaporator, and an 8°C (47°F) defrost temperature. These capacities can be adjusted depending on the evaporator type and mass, the thickness of frost and other factors affecting the duration of the defrost process.

Equalizing the coil pressure after a defrost is critical to ensure that large suction valves do not open immediately and “shock” the system after the defrost has been terminated. This is especially true on large, low temperature coils, where the difference between the defrost pressure and the house suction is the greatest, and where the internal volume of the coil is largest. The addition of a vent solenoid (usually piped in parallel to the automatic suction valve), which opens for a pre-determined period after defrost (when the hot gas solenoid de-energizes, and the suction stop valve or suction solenoid remains closed), slowly bleeds down the coil pressure. This effectively allows the defrost to terminate in a “soft” and safe manner.

Equalizing the coil pressure after a defrost is critical to ensure that large suction valves do not open immediately and “shock” the system after the defrost has been terminated. This is especially true on large, low temperature coils, where the difference between the defrost pressure and the house suction is the greatest, and where the internal volume of the coil is largest. The addition of a vent solenoid (usually piped in parallel to the automatic suction valve), which opens for a pre-determined period after defrost (when the hot gas solenoid de-energizes, and the suction stop valve or suction solenoid remains closed), slowly bleeds down the coil pressure. This effectively allows the defrost to terminate in a “soft” and safe manner.

Hot Gas Defrost

Defrost Controller

The Refrigerating Specialties defrost controller is a powerful, yet user friendly, device for controlling the sequence of events that occur during system defrost cycles. The controller may be applied to both industrial and commercial refrigeration systems, and is suitable for use on hot gas, electric, or water defrost applications.

Features

- Digital display
- Wide range of programmable features
- Easily upgradable to new versions of software
- Three selectable defrost initiation and termination modes
- Real time 24 hour digital clock
- 30 day time/date/day retention after power failure
- Weekend/holiday energy-saving schedules
- Settings stored indefinitely in nonvolatile memory
- RS485 communication port
- Operating temperature range 5°F to 120°F (-20°C to 50°C)
- UL/CSA/CE Approval

Basic Operating Modes

The Refrigerating Specialties defrost controller operates in any of the three basic modes below.

Normal Operation: Defrost cycles occur according to any of the initiation and termination modes.

Initiation modes: 24 hour / constant interval, constant interval, exact time, liquid feed time, remote, 24 hour / constant / remote, constant remote, or exact remote.

Termination modes: Time, time / temperature, or time remote

Weekend Operation: Allows the user to specify a special schedule to occur once each week for 1-3 days. At the end of the weekend, the normal schedule resumes. Weekend operation only works in conjunction with 24 hour / constant interval initiation.

Holiday Operation: Allows the user to specify a holiday schedule that occurs one-time only for a period of one to six days. At the end of the holiday schedule, either the normal or weekend Schedule will resume, depending on the day of the week. Holiday operation observes the defrost frequency programmed for weekend operation.

Within each of these operating modes, the controller will initiate or terminate defrost cycles based on a variety of criteria.

Defrost Cycle

The Refrigerating Specialties defrost controller will go through the following sequence when initiating a defrost cycle.

Pump Out Cycle: This prepares the evaporator for defrost by allowing the liquid refrigerant in the evaporator to be pumped or drained out through the suction line. The length of this pump out cycle is user defined, and can vary from 1 to 30 minutes.

Soft Gas Cycle (optional): The soft gas cycle reduces the likelihood of damaging pressure shocks on the evaporator coil. The length of this soft gas cycle is user defined, and can vary from 0 to 15 minutes.

Hot Gas Cycle: The length of the hot gas cycle is user defined, and can vary from 1 to 45 minutes. This cycle may also be terminated before the time expires by an analog temperature measurement that has reached its pre-set limit, or a closed remote contact.

Equalization Cycle: The equalization phase can reduce or eliminate system disruptions and sudden compressor loading caused by warm refrigerant being quickly released into the system, as well as a reduction of vapor propelled liquid. The length of this equalization cycle is user defined, and can vary from 1 to 60 minutes.

Fan Delay Cycle: This allows any remaining droplets of water on the evaporator coil to freeze, so they are not blown into the refrigerated space upon fan start up. The length of the fan delay is user defined, and can vary from 1 to 5 minutes.

Safety Relief Valves - H Series

The H series high capacity safety relief valves are designed and constructed to meet the requirements of ASME Boiler and Pressure Vessel Code and ANSI/ASHRAE 15-2007 Code requirements and bear the ASME Code Symbol (UV) indicating compliance with these codes. Employing proven principles of design, these safety relief valves are highly reliable and dependable. Precision machined moving parts of stainless steel, a PTFE disc and a cadmium-plated spring prevent sticking due to corrosion or cold welding, to assure valve opening at the set pressure long after installation. They are not suitable for corrosive ambient atmospheres such as chlorine, etc. The two-bolt flanged bottom inlet affords simple removal and replacement.

Two relief valves can be mounted on a Type M dual stop valve manifold. This arrangement permits either valve to be shut off individually and removed for repairs or inspection. Thus, one valve is always in service as required by most codes.

The high capacity of the H series valve permits the use of a small size valve which results in space saving. The valves are very sturdy and compact, requiring small headroom. The dual valve manifold assembly is especially compact and easily assembled.

Specifications

Temperature Range -45°C to 150°C (-50°F to 300°F)
 Pressure Relief Settings 3.4 to 20.7 barg (50 to 300 psig)
 Maximum Rated Pressure (MRP) 27.6 barg (400 psig)
 Body Cast Iron
 Internal Parts Stainless Steel
 Seat PTFE
 Capacity Rating Vapor Only

Application

Used with ammonia and halocarbon refrigerants in noncorrosive environments. Relief valves protect each refrigeration system pressure vessel that can be isolated by valves. Municipal codes may govern selection and installation. They may be patterned after the ASME boiler and pressure vessel code and the ANSI/ASHRAE 15-2007 safety code for mechanical refrigeration. ANSI/ASHRAE 15-2007 is highly recommended if there is no compulsory code.

The H series safety relief valve is intended to prevent the pressure of the vessel from rising more than 10% above:

- (1) the design working pressure (DWP) of the vessel or
- (2) the pressure setting of the relief device.

Whenever conditions permit, it is advisable to have the relief valve pressure setting at least 25% higher than the normal operating pressure for the system.

The relief valve pressure setting must not exceed the design working pressure of the vessel.

Selection Data

On positive displacement compressor systems, pressure limiting devices – such as high pressure cutouts – must stop the action of the pressure imposing element at no higher than 90% of the pressure setting of the pressure relief device.

On non-positive displacement compressors, pressure limiting devices – such as high pressure cutout – may be set at the design working pressure (DWP) of the high side, provided:

1. The low side is protected by a properly sized pressure at the low side DWP and
2. There are not stop valves in the system that isolate the high side from the low side.

Discharge piping from relief devices must not exceed lengths specified in ANSI/ASHRAE 15-2007 with discharge to atmosphere. Per ANSI/ASHRAE 15-2007, the formula for determining the minimum required discharge capacity of a relief device for each pressure vessel where the vessel is valved off from the refrigerating systems is:

$$C = fDL, \text{ where:}$$

C = capacity, lb/min air
 f = a factor from the table below
 D = outside diameter of the vessel in feet
 L = length of vessel in feet

Value of Factor (f)

Refrigerant	Factor (f) English (Metric)
R-717	0.5 (0.041)
R-22	1.6 (0.131)
R-134a	1.6 (0.131)
R-404a	2.5 (0.203)
R-410a	2.5 (0.203)
R-407c	1.6 (0.131)

SRVs

Safety Relief Valves - SR Series

Low capacity SR safety relief valves are designed and constructed to meet the requirements of Section VIII ASME Boiler and Pressure Vessel Code and ANSI/ASHRAE 15-2007 safety code for mechanical refrigeration. The low capacity SR safety relief valve meets the requirements for new installation and municipal ordinances. Precision machined moving parts of stainless steel and a PTFE disc prevent sticking due to corrosion or cold welding, to assure valve opening at the set pressure long after installation.

Specifications

Temperature Range -45°C to 150°C (-50°F to 300°F)
 Pressure Relief Settings 10.3 to 27.6 barg (150 to 400 psig)
 Maximum Rated Pressure (MRP) 27.6 barg (400 psig)
 Body Material Cast Iron
 Internal Parts Stainless Steel
 Seat PTFE
 Capacity Rating Vapor Only

Application

Used with ammonia and halocarbon refrigerants in noncorrosive environments. Relief valves protect each refrigeration system pressure vessel that can be isolated by valves.

The SR series safety relief valve is intended to prevent the pressure of the vessel from rising more than 10% above:

- (1) the design working pressure (DWP) of the vessel or
- (2) the pressure setting of the relief device.

Whenever conditions permit, it is advisable to have the relief valve pressure setting at least 25% higher than the normal operating pressure for the system.

The relief valve pressure setting must not exceed the design working pressure of the vessel.

Manifold

Type M1 manifolds designed to ASME VIII, ASHRAE and IIAR standards are available for use with SR valves.

Selection Data

See page 75 for the formula to determining the minimum required discharge capacity of a relief device for each pressure vessel.

Safety Relief Valves - SRH Series

High capacity SRH safety relief valves are designed and constructed to meet the requirements of Section VIII ASME Boiler and Pressure Vessel Code and ANSI/ASHRAE 15-2007. Designed to address the large installed population of safety relief.

Specifications

Temperature Range -45°C to 150°C (-50°F to 300°F)
 Pressure Relief Settings 10.3 to 27.6 barg (150 to 400 psig)
 Maximum Rated Pressure (MRP) 27.6 barg (400 psig)
 Body Material Cast Iron
 Internal Parts Stainless Steel
 Seat PTFE
 Capacity Rating Vapor Only

Application

Used with ammonia and halocarbon refrigerants in noncorrosive environments. Relief valves protect each refrigeration system pressure vessel that can be isolated by valves.

The SR series safety relief valve is intended to prevent the pressure of the vessel from rising more than 10% above:

- (1) the design working pressure (DWP) of the vessel or
- (2) the pressure setting of the relief device.

Whenever conditions permit, it is advisable to have the relief valve pressure setting at least 25% higher than the normal operating pressure for the system.

The relief valve pressure setting must not exceed the design working pressure of the vessel.

General Information

Manifold

Safety Relief Valves - SRLQ Series

SRLQ liquid relief valves are conventional, direct spring loaded safety relief valves designed to protect the liquid containing portions of vessels built to the ASME Boiler and Pressure Vessel Code. Employing proven principles of design, these safety relief valves are highly reliable and dependable. Precision machined moving parts of stainless steel, and a PTFE disc prevent sticking due to corrosion or cold welding and assure valve opening at the set pressure long after installation.

Specifications

Temperature Range	-45°C to 150°C (-50°F to 300°F)
Pressure Relief Settings	3.4 to 6.9 barg (50 to 100 psig)
Maximum Rated Pressure (MRP)	27.6 barg (400 psig)
Body	Cast Iron
Internal Parts	Stainless Steel
Seat	PTFE
Capacity Rating	Liquid Only

Application

The type SRLQ valves are for use with ammonia and halocarbon refrigerants in non-corrosive environments. Typical applications are liquid lines, ASME rated liquid transfer vessels and other critical system components such as heat exchangers, condensers and coolers from the effects of system blockages and continued heat input. Other suitable applications are vessels containing lubricating oil such as an oil cooler. Not suitable for water or other corrosive fluids.

Pressure setting and capacities apply only when the valve is discharging to atmospheric pressure.

The relief valve pressure setting must not exceed the design working pressure of the vessel.

Selection Data

The type SRLQ safety relief valve is intended to prevent the pressure of the vessel from rising more than 10% above the design working pressure (DWP) of the vessel or the pressure setting of the relief device, whichever is the lower pressure.

Whenever conditions permit, it is advisable to have the relief valve pressure setting (which must not exceed the design working pressure of the vessel) at least 25% higher than the normal operating pressure for the refrigerant used.

Pressure limiting devices, such as high pressure cutouts on positive displacement compressor systems, must stop the action of the pressure imposing element at no higher than 90% of the pressure setting for the pressure relief device.

For non-positive displacement compressors, the pressure limiting device, such as a high pressure cut-out, may be set at the DWP of the high side; providing, the low side is protected by a properly sized pressure relief device set to relieve pressure at low side DWP and there are no stop valves in the system that isolate the high side from the low side.

Discharge piping from relief devices must not exceed specified lengths indicated in ANSI/ASHRAE 15 with discharge to atmosphere.

The capacity ratings determined by the National Board are based on water as the test fluid. Capacity for other fluids will vary and must be corrected based on specific gravity and viscosity of the fluid at the actual or worst case service conditions.

Recommended sizing guidelines should follow local codes ANSI/ASHRAE 15, IIAR, ASME Section VIII Division 1 and API-520.

Hand Shut-Off Valves (Standard and Extended Bonnets)

This complete line of all steel body hand shut-off valves with bolt-on bonnets is designed and built to maintain reliability both in their seating and back seating functions. This entire line is supplied with stainless steel stems for maximum corrosion resistance and back seating capability. Maintenance costs are reduced and simplified with bolt-on bonnets.

Specifications

Material: Body Cast Steel (A-352 GR, LCB)
 Standard Bonnet: 6mm - 38mm (1/4" - 1 1/2") Forged Steel
 50mm - 200mm (2" - 8") Ductile Iron
 Extended Bonnet: 6mm - 100mm (1/4" - 4") LCB Cast Steel
 Stem 304 Stainless Steel
 Packing 25% Carbon Filled PTFE
 Temperature Range* -50°C - 204°C (-60°F - 400°F)
 * Standard bonnets are not designed to be used with insulation.
 Maximum Rated Pressure (MRP) 27.6 barg (400 psig)

Capacities for R717 are based on -5°C liquid and -5°C evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 25mm port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 1.03 bars.

Known: The capacity of a 25mm port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 1.03 bars is 99 kW.

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (kW)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 99 \text{ kW}$$

$$Q_{3:1} = 132 \text{ kW}$$

Capacities for R134a are based on -5°C liquid and -5°C evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 25mm port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 1.03 bars.

Known: The capacity of a 25mm port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 1.03 bars is 22 kW.

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (kW)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 22 \text{ kW}$$

$$Q_{3:1} = 29 \text{ kW}$$

Capacities for R410a are based on -5°C liquid and -5°C evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 25mm port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 1.03 bars.

Known: The capacity of a 25mm port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 1.03 bars is 24 kW.

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (kW)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 24 \text{ kW}$$

$$Q_{3:1} = 32 \text{ kW}$$

Capacities for R717 are based on -5°C liquid and -5°C evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 25mm port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 1.03 bars.

Known: The capacity of a 25mm port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 1.03 bars is 49 kW.

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (kW)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 49 \text{ kW}$$

$$Q_{3:1} = 65 \text{ kW}$$

Capacities for R134a are based on -5°C liquid and -5°C evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 25mm port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 1.03 bars.

Known: The capacity of a 25mm port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 1.03 bars is 11 kW.

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (kW)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 11 \text{ kW}$$

$$Q_{3:1} = 15 \text{ kW}$$

Capacities for R410a are based on 20°F liquid and 20°F evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 1" port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 15 psi.

Known: The capacity of a 1" port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 15 psi is 3.4 Tons.

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (Tons)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 3.4 \text{ Tons}$$

$$Q_{3:1} = 4.5 \text{ Tons}$$

	2.07	173	178	263	287	319	353	395	427	475	512	534	562	571	602

Capacities for R507a are based on -5°C liquid and -5°C evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 25mm port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 1.03 bars.

Known: The capacity of a 25mm port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 1.03 bars is 8.6 kW.

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (kW)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 8.6 \text{ kW}$$

$$Q_{3:1} = 12 \text{ kW}$$

Capacities for R22 are based on -5°C (20°F) liquid and -5°C (20°F) evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 40mm (1½") port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 1.03 bars (15 psi).

Known: The capacity of a 40mm (1½") port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 1.03 bars (15 psi) is 93 kW (27 Tons).

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (kW)}$$

$$(b) Q_{n:1} \text{ (Tons)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (Tons)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 93 \text{ kW}$$

$$Q_{3:1} \text{ (Tons)} = \frac{4}{3} \times 27 \text{ Tons}$$

$$Q_{3:1} = 124 \text{ kW}$$

$$Q_{3:1} = 36 \text{ Tons}$$

Capacities for R507a are based on -5°C (20°F) liquid and -5°C (20°F) evaporator temperature. For other evaporator temperatures, these values will change only slightly due to density and latent heat variations.

A recirculation rate of 4:1 was used to calculate the capacity tables. For other recirculation rates, divide 4 by the new recirculation rate and multiply values shown in table to arrive at new capacity.

Example: Calculate the capacity of 40mm (1½") port hand expansion valve at three turns with recirculation rate of 3:1 and a pressure drop of 1.03 bars (15 psi).

Known: The capacity of a 40mm (1½") port hand expansion valve at three turns with a recirculation rate of 4:1 and a pressure drop of 1.03 bars (15 psi) is 71 kW (20 Tons).

$$(a) Q_{n:1} \text{ (kW)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (kW)}$$

$$Q_{3:1} \text{ (kW)} = \frac{4}{3} \times 71 \text{ kW}$$

$$Q_{3:1} = 95 \text{ kW}$$

$$(b) Q_{n:1} \text{ (Tons)} = \frac{4}{\text{New Recirculation Rate (n)}} \times Q_{4:1} \text{ (Tons)}$$

$$Q_{3:1} \text{ (Tons)} = \frac{4}{3} \times 20 \text{ Tons}$$

$$Q_{3:1} = 27 \text{ Tons}$$

Capacities for R717 are based on 30°C (86°F) condensing temperature and 3.45 bar (50 psig) pressure drop across the valve.

Capacities for R22 are based on 40°C (100°F) condensing temperature and 3.45 bar (50 psig) pressure drop across the valve.

Capacities for R410a and R507a are based on 40°C (100°F) condensing temperature and 3.45 bar (50 psig) pressure drop across the valve.

Rapid Purger (V200)

The Model V200 Rapid Purger is a unique energy-saving device designed to efficiently remove foreign non-condensable gases from ammonia refrigeration systems.

Non-condensables like air, hydrogen, nitrogen, and hydrocarbon gases reduce the overall capacity of the refrigeration system. Higher pressures, which in turn causes longer compressor runtime, longer condenser fan runtime, higher compressor discharge temperatures, increase compressor power costs, increase wear and tear on equipment, increase leaks, reduce system efficiency, increase overall system energy costs are all consequences of non-condensables in the refrigeration system.

In a refrigeration system non-condensables can be introduced by:

- Inadequate system evacuation such as servicing compressors, strainers, valves, start-up, etc.
- Refrigerant additions
- Leaks from valve stem packing, bonnet gasket, compressor shaft seal, control transducers, etc.
- Separation of ammonia molecules (hydrogen and nitrogen)
- Compressor oil breakdown (hydrocarbon gases)

The base V200 Rapid Purger removes the non-condensable gases from four purge points. With the addition of purge points the auto purger is capable of purging a total of 20 purge points. This leads to lower condensing pressure, runtime of the compressors, and operating costs.

Non-condensable indicators are excessively high condensing temperatures/pressures and saturated temperature/pressure deviations. One indicator is a higher saturated condensing pressure/temperature at the condenser for the given outdoor air wet bulb and heat rejection load. Another indicator is the increasing difference between the observed condensing pressure and the saturation pressure corresponding to the liquid refrigerant temperature exiting the condenser.

Product Features

- Smaller compact design with equivalent capacity of our current model
- Light weight 29.5 kg (65 lbs)
- Proprietary microprocessor control for all sensing and control functions
- Factory calibrated and wired
- Auto or manual cycling capabilities
- Up to 20 "Purge Points"
- Automatically adjusts vent pressures
- Energy saving sleep mode that will activate with lack of non-condensables
- Electronic level, temperature, and pressure monitoring for improved performance
- Records number of purger cycles and times for each purge point during a 7 day period
- Purger is made of corrosion resistant material

Auto Purger

Modulating Refrigerant Valve (MVS)

The MVS Industrial Electronic Control Valve utilizes electronic controls to regulate both liquid and vapor refrigerant flows. MVS valves can be applied to manage liquid levels in vessels, superheat for direct expansion evaporators, brine temperature in chillers, hot gas for defrost, and countless other installations.

Function

MVS valves employ a linear magnetic actuator for valve positioning. This actuator reacts to the control input provided by the process controller. Together, the valve and controller can provide unmatched precision and versatility in a variety of applications.

Specifications

Power Supply: AC 24V \pm 20% (45...65Hz) 12W
 DC 20...30V (0.5/2A max.)
 Single Output DC 0/2 - 10V or DC 0/4 - 20mA
 Material: Body Steel/CrNi Steel
 Seat/Piston CrNi Steel
 Sealing Disk/O-ring PTFE/CR
 Pipe connection (Socket Weld): 33.7mm

Features

- CE conformity to EMV requirements
- NEMA 3R (IP65) electrical construction
- Conform to UL and CSA
- Complies with Pressure Equipment Directive (PED) 97/23/EC
- Hermetically sealed
- High resolution and control accuracy
- Precise positioning control and position feedback signal
- Outfitted with position feedback
- Fast response (0-100% Open < 1 sec.)
- On-board diagnostics
- Replaceable capacity cartridges
- Corrosion resistant construction
- Spring return offers tight shut-off in the event of a power failure

Liquid Level Transmitter (HBLT)

HBLT capacitive liquid level transmitters are used to measure liquid levels in refrigerant vessels. The HBLT comes factory calibrated for ammonia (for other refrigerants contact factory), so that it will cover 4 to 20 mA throughout the rod's whole measure range. 4 mA when the transmitter does not register liquid and 20 mA when the entire transmitter is surrounded by liquid. The 4 to 20 mA signal from the HBLT can be used in conjunction with a controller to control the liquid level.

Function

The electronic insert of the probe converts the measured change in capacitance of the liquid to a signal in proportion to the level (4 to 20 mA) making it possible to display, control and or regulate the liquid level when used in conjunction with a controller.

Specifications

Supply Voltage and Load	24V AC/DC ±10% (50/60Hz), 1.5W
Maximum Load Resistance	500 ohms
Electronic Connection	4-pole DIN plug
Liquid Temperature Range	-60°C - 80°C (-76°F - 176°F)
Ambient Temperature	-25°C - 50°C (-13°F - 122°F)
Maximum Rated Pressure (MRP)	100 bar (1450 psig)
Material: Thread	AISI 303 Stainless Steel
Reference Pipe	AISI 304 Stainless Steel
Inner Electrode	PTFE
Electronic Top Part	Coated Cast Aluminium

Features

- Plug and play: no calibration required when installed on ammonia systems
- Service friendly: electronic head and sensor tube can be separated without emptying the vessel
- Damping of output signal
- Improved calibration: range/signal output can be adapted to suit the actual application
- LED indication can be supplied with a LED Bargraph as option for indication of liquid level
- Enclosure IP65 classified

General Information

Probe Length	mm	152	203	305	389	488	587	762	889	1143	1397	1651	2159	2667	3048
	inch	6.0	8.0	12	15	19	23	30	35	45	55	65	85	105	120

Note

Liquid level transmitters less than 305 mm (12") are not compatible with halocarbons. For measuring liquid levels less than 305 mm (12") use the HBLC liquid level control sensor, see page [136](#) for more information.

Liquid Level Switches (HBSR, HBS01 & HBSC2)

HBS capacitive sensors are designed for industrial applications and long term function. These compact, cost effective switch designs, provide reliable and accurate detection of fluid levels in equipment such as liquid separators, high and low pressure receivers, economizers, oil coolers, oil pots, and compressors.

Switches operate according to the capacitive principle detecting presence of any kind of conductive or non-conductive liquid.

Specifications

Supply Voltage and Load	24V DC \pm 10%
Maximum Output Current	50mA
Output	NPN
Output Function	NO/NC
Electronic Connection	4-pole DIN plug
Temperature	Range:
HBSR	-50°C - 100°C (-58°F - 212°F)
HBS01	0°C - 85°C (32°F - 185°F)
HBSC2	-50°C - 100°C (-58°F - 212°F)
Ambient Temperature	-20°C - 50°C (-4°F - 122°F)
Maximum Rated Pressure (MRP):	
HBSR	100 bar (1450 psig)
HBS01	150 bar (2175 psig)
HBSC2	150 bar (2175 psig)
Material: Thread	AISI 303 Stainless Steel
Reference Pipe	AISI 304 Stainless Steel
Inner Electrode	PTFE or S.S. AISI 304
Electronic Head	GF BLK, Nylon 6, Glass Fiber
Connection:	
HBSR	3/4" NPT
HBS01	1/2" & 3/4" NPT
HBSC2	3/4" NPT

Features

- Plug and play: no calibration required when installed on ammonia systems
- Service friendly: electronic head and sensor tube can be separated without emptying the vessel
- Unaffected by foam, splashing and coating
- Resists high pressures and temperatures
- LED indication when liquid is present

HBSR

Switches on when conductive liquid is present. The switch distinguishes between oil and NH₃/HFC/brine and therefore ideal for automatic oil draining and emptying systems.

HBSC2

Switches on when liquid CO₂ is present. Ideal for high/low level indication, control alarm or CO₂ applications with pressures up to 170 bar (2465 psig)

HBS01

Switches on when oil is present. Ideal for oil management and oil level control as well as for compressor protection.

HBSR (top)

Refrigerant switch (NH₃, HFC, Brine)

HBS01 (middle)

Oil level switch

Note

Media temperatures below -30°C (-22°F) require the HBHE heating element.

Liquid Level Control Sensor (HBLC-V/C)

The liquid level control sensor, HBLC, is a stand-alone sensor with control function built-in to control refrigerant levels in high and low pressure condensers, evaporators and chillers. The HBLC sensor works in conjunction with a 4-20mA modulating control or solenoid valve.

This compact, cost effective sensor design, provides reliable and accurate detection of refrigerant levels in equipment.

Specifications

Supply Voltage and Load	24V DC \pm 10%
Analog Output	4 - 20mA
Maximum Current Consumption.....	30mA
Potential Free Output	On/Off, Max 1A (24W)
Output	PNP/NPN
Output Function	NO/NC
Cable Length	3m (118")
Electronic Connection	M12, 5 pin
Temperature Range	-50°C - 100°C (-58°F - 212°F)
Ambient Temperature	-20°C - 50°C (-4°F - 122°F)
Maximum Rated Pressure (MRP)	100 bar (1450 psig)
Material: Thread	AISI 303 Stainless Steel
Inner Electrode	PTFE or S.S. AISI 304
Electronic Head	GF BLK, Nylon 6, Glass Fiber
Connection:	$\frac{3}{4}$ " NPT

Features

- Suitable for ammonia and water/brine (HFC and CO₂ types are available on request)
- Stand alone microprocessor sensor with controller built in for automatic liquid management
- Easy setup and change of timer and alarm settings
- "Service Friendly" Split design for easy mounting, maintenance and remote programming without depressurization
- Unaffected by foam, splashing and coating
- Resists high pressures and temperatures
- LED indication for liquid, alarm and power
- Savings on installation, cost and time

LED Indication

Yellow - Liquid
 Green - Power
 Red - Alarm

Oil Level Control Sensor (HBOC-V/C)

HBOC is a stand-alone sensor and controller for easy and safe distribution of oil with built-in adjustable timer, alarm, alarm reset and compressor running signal. The oil level control sensor, in conjunction with a 24V DC solenoid valve, is designed to control oil levels in compressors and oil separator systems. This compact, cost effective sensor design, provides reliable and accurate detection of oil levels in equipment.

The oil carry over from compressors in multiple compressor parallel rack systems require proper oil management. The HBOC has been designed to control lubrication and prevent compressor break down.

Specifications

Supply Voltage and Load	24V DC \pm 10%
Maximum Current Consumption.....	30mA
Potential Free Output	On/Off, Max 1A (24W)
Output	PNP/NPN
Output Function	NO/NC
Cable Length	3m (118")
Electronic Connection	M12, 5 pin
Temperature Range	0°C - 85°C (32°F - 185°F)
Ambient Temperature	-20°C - 50°C (-4°F - 122°F)
Maximum Rated Pressure (MRP)	150 bar (2175 psig)
Material: Thread	AISI 303 Stainless Steel
Reference Pip	AISI 304 Stainless Steel
Inner Electrode	AISI 303 Stainless Steel
Electronic Head	GF BLK, Nylon 6, Glass Fiber
Connection:	$\frac{3}{4}$ " NPT

Features

- Stand alone microprocessor sensor with controller built in for automatic oil management
- Easy setup and change of timer and alarm settings
- "Service Friendly" Split design for easy mounting, maintenance and remote programming without depressurization
- Unaffected by foam, splashing and coating
- Resists high pressures and temperatures
- LED indication for oil, alarm and power
- Savings on installation, cost and time

LED Indication

Yellow - Oil
Green - Power
Red - Alarm

Note

Only DC supply for operating solenoid valves.

Refrigerant Float Switch (LLSS)

The LLSS refrigerant float switch is a mechanical float device which indicates a particular level of refrigerant in a vessel. It consists of a stainless steel welded chamber containing a float on the inside with a limit switch mounted on top. The chamber has a float-rod assembly inside with a metallic attractor located on the upper end of the rod. As the level in the system rises, the liquid fills the chamber causing the float ball to rise. The rising float with the attractor comes in close proximity of the magnet located inside the switch assembly. The magnet is mounted on a lever that operates a snap action switch. The switch can turn an electrical circuit on or off.

The float switch is used to open and close solenoid valves, to activate or de-activate electrical controls, to energize or de-energize magnetic starters for starting and stopping refrigerant liquid pumps and compressors, and as a safety device, to sound alarms and turn on lights when there is high or low liquid level. The electrical switch and operating mechanism are encapsulated within a UV resistant transparent housing.

Specifications

Specific Gravity Range 0.57 to 1.7
 Switch Ambient Temperature -45°C - 65°C (-150°F - 150°F)
 Tank Fluid Temperature -75°C - 65°C (-100°F - 150°F)
 Maximum Tank Rated Pressure (MRP) 31 bar (450 psig)
 Power 120VAC/240VAC/125VDC 10A/10A/0.5A

Features

- Suitable for Ammonia, R22, R-507, R-134a, and other common refrigerants
- Magnetically actuated switch
- UV resistant and transparent switch housing
- Stainless steel float chamber assembly
- Single pole double throw switch
- Float switch tank weighs 3.08 kg (6.8 lbs)
- Hermetically sealed
- All components in direct contact with refrigerant are stainless steel constructed
- Complies with Pressure Equipment Directive (PED) 97/23/EC (DIN connector only)
- Switch assembly is compatible with R/S liquid level models LL, LLS, and LLA

Liquid Level Sight Glass (SG1)

The Refrigerating Specialties liquid level sight glass SG1 provides a clear indication of liquid levels in industrial and commercial refrigeration systems.

As the refrigerant liquid level rises in the viewing area of the reflex lens, the color of the lens will turn dark. As the level decreases the color of the lens lightens.

Specifications

Temperature Range -50°C - 115°C (-60°F - 240°F)
Maximum Rated Pressure (MRP) 27 bar (400 psig)

Features

- Suitable for Ammonia, R-22, R-507, R-134a, and other common refrigerants
- Suitable for ASME Applications
- Reflex lens
- Frost shield available

See page [206](#) for dimensional information. Dimensions include frost shield.

Thermostatic Expansion Valves (TXV)

Ammonia Applications Only

Thermostatic expansion valves for ammonia applications require special design considerations due to the erosive effects of ammonia vapor. For this type of application, Refrigerating Specialties has developed the types D and A thermostatic expansion valves. Like other components of ammonia systems, the types D and A valves are made from steel and steel alloys.

With ammonia systems, the formation of flash vapor at the expansion valve port causes valve seat erosion or wire drawing to occur. This effect is further aggravated by high velocity ammonia mixed with dirt or scale passing through the port of the expansion valve. Fortunately, seat erosion can be minimized and valve life extended if the following steps are taken:

1. Maintain vapor-free liquid at the TXV inlet at all times
2. Maintain clean ammonia through effective filtration
3. Reduce the velocity of the ammonia through the TXV port by reducing the pressure drop across the port

Step 1: can be accomplished through proper system design. Liquid line vapor is prevented by adequately sizing liquid lines and providing sufficient subcooling.

Step 2: can be assured with the use of a Parker Replaceable Core Dryer. This filter dryer is an effective scale trap when used on ammonia systems. For further information on the use of this dryer with ammonia systems, refer to page [152](#) of this catalog.

Step 3: can be accomplished with the use of a removable discharge tube or the nozzle of a refrigerant distributor. These components reduce the velocity and pressure drop at the expansion valve port by introducing a restriction or added pressure drop in the valve outlet passage.

The removable discharge tube is threaded into the outlet of the type D valves, and the nominal 70.3, 105 and 176 kW (20, 30 and 50 ton) type A valves. The discharge tube is the principle difference between ammonia TXVs and TXVs used with other refrigerants.

The discharge tube in the outlet passage must be removed when the TXV is combined with a R/S Ammonia Distributor and Nozzle. If the discharge tube is not removed from the valve, the combination of the discharge tube and distributor nozzle may create an excessive pressure drop resulting in a substantial loss of TXV capacity. Refer pages [147](#) - [150](#) for further information on ammonia distributors.

The nominal 264 and 352 kW (75 and 100 ton) type A valves do not employ a discharge tube since their valve outlets are designed to serve as a secondary orifice to reduce pressure drop across the valve port.

Thermostatic Charges for Ammonia Valves

Thermostatic charges C and L are available for the Type D thermostatic expansion valve. The type L thermostatic charge is the only charge available for the type A valve.

The types C thermostatic charges provide operating advantages for systems that cycle in response to a suction pressure switch or thermostat. These charges are also recommended for systems using a small capacity compressor. The table below lists the recommended temperature range for each charge.

Cold storage plants often have large centralized ammonia systems consisting of many evaporators connected to one or more large compressors. This makes for fairly stable suction pressures. The R/S type L charge responds more quickly to changes in bulb temperature, allowing for a quicker pull-down of the conditioned space temperature. Therefore, for large ammonia systems consisting of multiple evaporators, the Type L charge is recommended.

Thermostatic Charge	Evaporator Temperature
C	4°C to -18°C (40°F to 0°F)
L	-29°C to 4°C (-20°F to 40°F)

For applications at evaporator temperature below -29°C (-20°F) consult R/S

Cold storage plants often have large centralized ammonia systems consisting of many evaporators connected to one or more large compressors. This makes for fairly stable suction pressures. The R/S type L charge responds more quickly to changes in bulb temperature, allowing for a quicker pull-down of the conditioned space temperature. Therefore, for large ammonia systems consisting of multiple evaporators, the type L charge is recommended.

TXVs

Thermostatic Expansion Valves (TXV)

Type D - FPT Flange Connections

The type D valve is an externally adjustable valve with a gray cast iron body. It is supplied with FPT connections (1/2" SW available). The thermostatic element is replaceable, and all internal parts are serviceable. An optional XD-074 (1/2" FPT) external inlet strainer may be ordered with this valve. The nominal 3.52 and 7.03 kW (1 and 2 ton) type D valves are identical, with the exception of their discharge tubes, as are the nominal 35.2 and 52.7 kW (10 and 15 ton) valves. One of these valves can be converted to the other by exchanging the discharge tubes.

Refrigerant distributors that will mate directly to this valve are listed below.

Note: The discharge tube must be removed when a refrigerant distributor is applied to the valve.

D	Gray Iron Casting	Stainless Steel or Steel Alloy	Tungsten Carbide	Stainless Steel	Stainless Steel	Gasket	FPT (1/2" SW only)	Removable Strainer Screen

Note: The DA to a DAE do not use the same body and are not inter changeable.
 Discharge tubes are only interchangeable when thermostatic expansion valves (TXV) have the same port size.

Thermostatic Expansion Valves (TXV)

Type A - FPT Flange Connections

The type A valve is an externally adjustable valve with a gray cast iron body and either FPT or socket weld flange connections. The thermostatic element is replaceable. An optional 8004 (1/2" FPT) or 8006 (3/4" FPT) strainer may be ordered with this valve.

The nominal 70.3 and 105 kW (20 and 30 ton) type A valves are identical with the exception of their discharge tubes. One of these valves can be converted to the other by exchanging their discharge tubes. The nominal 264 and 352 kW (75 and 100 ton) type A valves do not employ a discharge tube, nor are their outlets tapped to receive one.

Refrigerant distributors that will mate directly to this valve are listed below. Note: The discharge tube must be removed from the nominal 70.3, 105 and 176 kW (20, 30 and 50 ton) type A valves when a refrigerant distributor is applied.

Thermostatic Expansion Valves Selection Procedure

The following procedure should be used when selecting a R717 Ammonia TXV:

1. Determine the pressure drop across the valve

Subtract the evaporating pressure from the condensing pressure. The condensing pressure used in this calculation should be the minimum operating condensing pressure of the system. From this value, subtract all other pressure losses to obtain the net pressure drop across the valve. Be sure to consider all of the following possible sources of pressure drop: (1) friction losses through refrigeration lines including the evaporator and condenser; (2) pressure drop across liquid line accessories such as a solenoid valve and filter-drier; and (3) static pressure loss (gain) due to the vertical lift (drop) of the liquid line, see Table 1.

Table 1

Refrigerant	Vertical Lift				
	6.1 m (20 ft)	12.2 m (40 ft)	18.3 m (60 ft)	24.4 m (80 ft)	30.5 m (100 ft)
717 Ammonia	0.34 bar (5 psi)	0.69 bar (10 psi)	1.03 bar (15 psi)	1.38 bar (20 psi)	1.72 bar (25 psi)

It is not necessary to subtract the pressure drop across the refrigerant distributor when determining the pressure drop across a R/S Type D or type A valve with a nominal rating of 176 kW (50 tons) or less. These valves employ a discharge tube in the valve outlet passageway, and it should be removed when a distributor is connected to the valve. R/S distributors are normally selected to provide a 2.76 bar (40 psi) pressure drop at design load conditions for ammonia applications. Removing the discharge tube from the valve will compensate for this pressure drop.

2. Determine the liquid temperature of the refrigerant entering the valve

The R-717 Ammonia TXV rating tables on page 143 are based on a liquid temperature of 30°C (86°F). For other liquid temperatures, apply the correction factor given in the table.

The valve capacity should equal or slightly exceed the tonnage rating of the system.

3. Select valve from the rating tables

Select a valve based on the design evaporating temperature and the available pressure drop across the valve. If possible, the valve rating should equal or slightly exceed the design rating of the system. Be sure to apply the appropriate liquid temperature correction factor to

the valve ratings shown in the tables. Once the desired valve rating has been located, determine the nominal capacity of the valve from the second column of the table. On multiple evaporator systems, select each valve on the basis of individual evaporator capacity.

4. Determine if an external equalizer is required

The amount of pressure drop between the valve outlet and bulb location will determine if an external equalizer is required. The recommendations given in Table 1 are suitable for most field installed systems. Use an externally equalized valve when pressure drop between the valve outlet and bulb location exceeds values shown in Table 2. An externally equalized valve must be used on evaporators, which employ a refrigerant distributor.

Table 2

Refrigerant	Evaporator Temperature			
	4°C (40 °F)	-7°C (20 °F)	-18°C (0 °F)	-29°C (-20 °F)
717 Ammonia	0.21 bar (3 psi)	0.14 bar (2 psi)	0.10 bar (1.5 psi)	0.07 bar (1.0 psi)

When the thermostatic expansion valve is equipped with an external equalizer, it must be connected. Do not cap off the equalizer connection, as it will prevent the valve from operating properly.

5. Select the R/S Selective Thermostatic Charge

Select the charge according to the design evaporator temperature and the valve application. The subject of R-717 thermostatic charges is discussed on page 140.

Selection Example: Refrigerant 717

Application: Refrigeration, single evaporator system

Design evaporator temperature	-15°C (5°F)
Design condenser temperature	32°C (90°F)
Refrigerant liquid temperature	27°C (80°F)
Design evaporator capacity	17.6 kW (5 tons)

Available pressure drop across TXV

Condensing pressure	11.4 barg (166 psig)
Evaporator pressure	1.31 barg (19 psig)
Pressure Drop	10.1 bar (147 psi)

Liquid line and accessories loss	0.48 bar (7 psi)
⊙ Distributor and tubes loss	0 bar (0 psi)
Total Pressure Drop	9.65 bar (140 psi)

Refrigerant liquid correction factor

The DAE-5 has a valve capacity of: 17.6 x 1.02 = 17.93 kW (5.00 x 1.02 = 5.10 tons) at -15°C (5°F) evaporator temperature, 9.65 bar (140 psi) pressure drop, and 27°C (80°F) liquid temperature.

Thermostatic charge, see page 140: C

Selection: DAE-5-C

⊙ An externally equalized valve must be used on evaporators employing a refrigerant distributor due to the pressure drop created by the distributor. Pressure drop due to the distributor is not used in the calculation to determine pressure drop across the TXV since the valve's discharge tube will be removed. Refer to step 1 of the selection procedure.

TXVs

Refrigerant Distributors

Direct Expansion – Steel & Aluminum Models – Flange Connections

The distributor body is type ASTM A108 cold rolled steel. The nozzle is Type 303 stainless steel, and the dispersion cone in the distributor is made of Satellite.

Distributor tube connections are available for 3/16", 1/4", and 5/16" OD steel tubing. The ODF connections are trepanned to facilitate welding the joint. A 1/8" NPT connection is also available with Types 1130, 1133, and 1138 distributors.

Aluminum models – These distributors are designed for R-717 aluminum coils, and they are 6061-T6 aluminum. As with the steel distributors, the dispersion cone is Satellite, and the nozzle is stainless steel.

Distributor tube connections are available for 3/16", 1/4", and 5/16" OD aluminum tubing. Aluminum brazing techniques require more space between circuits than copper to brass brazing. As a result, the maximum number of circuits is less than for comparable brass models.

Applying Distributors to Thermostatic Expansion Valves

All type D and type A TXVs up to and including 176 kW (50 tons), employ a discharge tube. The discharge tube reduces refrigerant velocity across the valve port, preventing premature pin and seat erosion. When a distributor is used with these valves, the distributor nozzle performs the discharge tube's function. The discharge tube must then be removed from the valve to avoid excessive pressure drop.

Distributor performance is best obtained if the distributor is bolted directly to the TXV outlet. When it is not possible to bolt the TXV to the distributor, or if a shut off valve is installed between them, use a short, straight piece of pipe to connect the two. The pipe should not exceed two feet. It should be sized to maintain high refrigerant velocities. Elbows between the TXV and distributor are not recommended since they hinder proper distribution.

Ratings for Refrigerant 717 Distributors

Full load ratings are based on 2.07 bar (30 psi) nozzle, 0.69 bar (10 psi) tube pressure drop and 30°C (86°F) liquid temperature entering thermostatic expansion valve.

Distributor Tube Circuit Capacities - R717 (KW)

Distributor Tube OD (Inches)	Evaporator Temperature (°C)					
	4°	-7°	-15°	-23°	-29°	-34°
3/16	6.29	4.47	3.55	2.88	2.53	2.25
1/4	15.9	11.3	8.97	7.28	6.4	5.7
5/16	34.2	24.3	19.3	15.7	13.8	12.3

Ratings based on 30°C (86°F) liquid entering TXV, 2.07 bar (30 psi) ΔP across nozzle, 0.69 bar (10 psi) ΔP across distributor tubes, 762 mm (30") tube length.

For information on applications and capacities at evaporator temperatures below -34°C (-30°F) consult R/S.

Note: For direct expansion application with liquid temperatures lower than tabulated values or for flooded liquid recirculation systems – contact R/S.

Refrigerant Distributors

Two 7/16" – 14 THD 2" long bolts connect these distributors to the Type D valve.

The types 1130 distributors do not require a companion flange. These distributors bolt directly to the type D valve using two 7/16" – 14 THD 1 1/2" bolts.

All distributors used with the type D valve require flange gasket P/N 207658.

The type 1138 distributors have a male flange ring that bolts directly to the type A valve.

Two 1/2" – 13 THD 1 3/4" long bolts connect these distributors to the type A valve.

All distributors used with type A valve require flange gasket P/N 207657.

XOF	3/8" NPT Female															

- ▶ Safe working pressure 20.7bar (300 psi).
- ▶ Dual voltage 4-wire coils, 120-240/60 are available at slight additional cost. For other voltages and cycles, consult R/S.
- ▶ Available with conduit boss or junction box at no extra charge.

Replaceable Core Filter Dryers

Ammonia Parker Replaceable Core Filter Dryers

The molded porous Replaceable Core Filter Dryer effectively removes scale and other fine particles – keeping the system clean – and prolonging the life of all moving parts.

Small amounts of water are not considered a problem in ammonia systems. Therefore, the “drier” function of the desiccant core is not normally required.

The type C-413-P is a sealed model filter-drier. All of the other models shown at the right are replaceable core types. Use the RC-4864 or RC-10098 replaceable cores for excellent filtration ability.

Note: Do not use RPE-48-BD and RPE-100 Filter Elements on ammonia systems.

Specifications

Temperature Range -46°C to 116°C (-50°F to 240°F)
 Maximum Rated Pressure (MRP) 34.5 barg (500 psig)

Replaceable Cores

Cores for replacement core type filter-driers are molded of exactly the same desiccants that are used in the popular sealed model filter-driers.

Cores are individually packed in metal cans, fully activated, and hermetically sealed against moisture and dirt.

The method of mounting the cores on the end plate by means of tie rods makes them very easy to install and remove.

Replaceable core filter dryers with pipe connections are supplied with an envelope containing 5 end plate gaskets. When replacement of end plate gasket is required, use one gasket from the envelope.

General Information

Type	Connections (Inches)	No. of Cores	Core Part No.	Volume of Desiccant (Cu. In.)	Mounting Brackets

Strainers

“XD” Type Strainers

Type XD Strainer is for use with Ammonia and other liquids where a steel construction is suitable. May be used with companion flange or can be bolted directly to type D thermostatic expansion valves.

Semi-cast steel body with FPT inlet and flanged outlet connections. Strainer screen is stainless steel with a seal plug for screen removal. Complete unit is zinc plated and painted.

Specifications

Maximum Rated Pressure (MRP) 34.5 barg (500 psig)

General Information

Type	Connections (Inches)		Screen		Mesh Size
	Inlet	Outlet	Area (sq.i.n.)	Part No.	
XD 074	½ FPT	Flange	6.6	635-3	100

Strainers are supplied with female companion flange. Strainers can be ordered without the flange.

“Y” Type Strainers

Type 8000 Strainer is used primarily for Refrigerant 717 Ammonia, but can also be used for halocarbon refrigerants (R-22, R-134a, and R-404A) and other liquids where a steel construction is applicable. FPT inlet, standard two bolt York flange outlet connections. Types 8004 and 8006 strainers can be bolted direct to the inlet of type A thermostatic expansion valves on ammonia applications. The unit is zinc plated.

Type 9000 Strainers for large Refrigerant 717 Ammonia installations are also adaptable to halocarbon refrigerant (R-22, R-134a, and R-404A) applications, and other liquids where steel construction is suitable. The strainer is zinc plated. FPT inlet, standard four bolt York flange outlet connections.

Specifications

Maximum Rated Pressure (MRP)

8000 series 34.5 barg (500 psig)
 9000 series 27.6 barg (400 psig)

General Information

Type	Connections (Inches)	Screen		Mesh Size
		Area (sq. in.)	Part No.	
8004	½ FPT*	15	4097-3	80
8006	¾ FPT *			
9008	1 FPT**	23	4110-3	60
9010	1¼ FPT**			

* Strainers are supplied without companion flange. Female companion flange, bolts, and gasket can be supplied when ordered.

** Strainers are supplied without companion flange. Male companion flange, bolts, and gasket can be supplied when ordered.

Level Master Control

Application and Installation

The R/S Level-Master Control is a positive liquid level control device suitable for application to all flooded evaporators.

Description and Operation

The LMC is a standard thermostatic expansion valve equipped with a Level-Master Element. The combination provides a simple, economical, and highly effective liquid level control. The bulb of the conventional thermostatic element has been modified to an insert type of bulb that incorporates a low wattage heater. A 15-watt heater is supplied as standard.

The insert bulb is installed in the accumulator or surge drum at the point of the desired liquid level. As the level at the insert bulb drops, the electrically added heat increases the pressure within the thermostatic element and opens the valve. As the liquid level at the bulb rises, the electrical input is balanced by the heat transfer from the bulb to the liquid refrigerant and the LMC either modulates or eventually shuts off. The evaporator pressure and spring assist in providing a positive closure.

Installation – General

The Level-Master Control is applicable to any system that has been specifically designed for flooded operation.

R/S is not responsible for system design and, therefore, is not liable for any damage arising from faulty design or improper piping, or for misapplication of its products. Figures 2 through 4 are piping schematics only to illustrate possible methods of applying the LMC valves.

If these valves are applied in any manner other than as described in this bulletin, the R/S warranty is void. Actual system piping must be done to protect the compressor at all times. This includes protection against overheating, slugging with liquid refrigerant, and trapping of oil in various locations. R/S recommends that recognized piping references, such as equipment manufacturers' literature and the ASHRAE Guide and Data Book, be consulted for assistance with this subject.

The valve is usually connected to feed into the surge drum above the liquid level. It can also feed into the liquid leg or coil header.

The insert bulb can be installed directly into the shell, surge drum or liquid leg on new or existing installations. Existing float systems can be easily converted by installing the LMC insert bulb in the float chamber.

The Level-Master Control may be installed at any ambient temperature. The element is protected against excessive temperature, created by the heater, by a thermostatic switch that is an integral part of the heater assembly.

Figure 1: Horizontal Position

Installation – Insert Bulb

The insert bulb should be installed at the point where the desired liquid level is to be maintained. The bulb must be in contact with the refrigerant, i.e., NOT installed in a well. If the insert bulb is projected directly into the surge drum, it should be shielded to prevent the possibility of splash from either the valve feed or the return from the coil. While generally installed in a horizontal position, see Figure 1, it will operate effectively at any angle or vertical position.

Minor adjustments in liquid level can be made with the adjusting stem provided on the expansion valve. The insert bulb assembly is provided with a lock ring and gasket joint so that the bulb may be removed without breaking the pipe joint.

Installation – Electrical Connections

The heater is provided with a two-wire neoprene covered cord two feet in length. It runs through a moisture-proof grommet and a 1/2" male conduit connection affixed to the insert bulb assembly, see Figure 2.

The heater circuit must be interrupted when refrigeration is not required and the compressor is cycled off. This will prevent shortening the life of the heater thermostat. To accomplish this, the heater is wired in parallel (on the compressor side) with the control or power relay, the holding coil of the compressor magnetic starter, or the liquid line solenoid valve.

Figure 2: Typical Installation

Level Master Control Design Precautions

Hand Valves

On installations where the valve is isolated from the surge drum by a hand valve, and a two to three pound pressure drop from the valve outlet to the bulb location is likely, we recommend that an externally equalized valve be used. (See ordering instructions.)

Oil Return

General – All reciprocating compressors will allow some oil to pass into the discharge line along with the discharge gas. Mechanical oil separators are used extensively; however, they are never completely effective. The untrapped oil passes through the condenser, liquid line, expansion device and finally into the evaporator.

In a properly designed direct expansion system, the refrigerant velocity in the evaporator tubes and in the suction line is sufficiently high to ensure a continuous return of oil to the compressor crankcase. But, this is not characteristic of flooded systems. Here, we purposely design the surge drum for a relatively low vapor velocity to prevent entrainment of liquid refrigerant droplets and consequent carryover into the suction line. This design criterion also prevents the return of any oil from the low side in the normal manner.

And if oil is allowed to concentrate at the insert bulb location of the R/S Level-Master Control, overfeeding with possible floodback can occur. The tendency to overfeed is due to the fact that the oil does not convey the heat from the low wattage heater element away from the bulb as rapidly as does pure liquid refrigerant. The bulb pressure is higher than normal and the valve remains in the open or partially open position.

Oil and Ammonia Systems

Liquid ammonia and oil are immiscible for all practical purposes. And since the density of oil is greater than that of ammonia, it will fall to the bottom of any vessel containing such a mixture, if the mixture is relatively placid. Therefore, the removal of oil from an ammonia system is a comparatively simple task. Generally, on systems equipped

with a surge drum, the liquid leg is extended downward below the point where the liquid is fed off to the evaporator and a drain valve is provided to allow periodic manual draining as shown in Figure 3.

For flooded chillers that do not use a surge drum, a sump with a drain valve is usually provided at the bottom of the chiller shell.

Figure 3: Surge Drum

The above methods are quite satisfactory, except possibly on some low temperature systems. Here, the drain leg or sump generally has to be warmed prior to attempting to draw off the oil since the trapped oil becomes quite viscous at lower temperatures. If oil is not drained from a flooded ammonia system, a reduction in the evaporator heat transfer rate can occur due to an increase in the refrigerant film

resistance. Difficulty in maintaining the proper liquid level with any type of flooded control can also be expected.

With a float valve, you can expect the liquid level in the evaporator to increase with high concentration of oil in a remote float chamber.

If a R/S Level-Master Control is used with the insert bulb installed in a remote chamber, oil concentration at the bulb can cause overfeeding with possible floodback. The lower or liquid balance line must be free of traps and be free draining into the surge drum or chiller as shown in Figure 4. The oil drain leg or sump must be located at the lowest point in the low side.

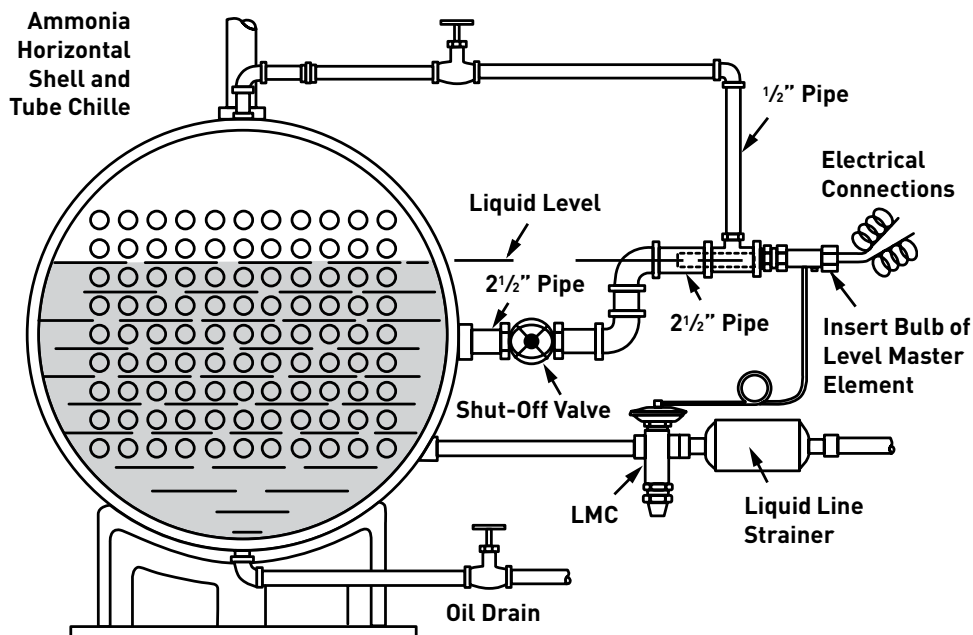

Figure 4: Typical Installation

Level Master Control

Capacity in Tons of Refrigeration

These ratings are based on vapor free (subcooled) liquid refrigerant entering the expansion valve (30°C/86°F for Refrigerant 717) and standard factory setting. Because of the artificial superheat provided by the electric heater, the Level-Master will have a greater capacity than a conventional thermostatic expansion valve. For selections for other refrigerants, contact Refrigerating Specialties.

Electrical Specifications

15/24-watt - 24v, 120v or 240v any frequency AC or DC.

Watts	Voltage	Amps
15	24	0.125
	120	0.625
	240	0.063
25	24	1.04
	120	0.20
	240	0.104

Standard Tubing Length

3.05 m (10 ft) – Other lengths in integrals of 1.54 m (5 ft) available on special order.

Replacement Parts

Internal parts kits – Same as standard thermostatic expansion valves. Specify valve type and port size.

Heater Element Assembly

Consists of heater element, lead wire, protective thermostatic switch, and moisture proof seal.

These factors include corrections for liquid refrigerant density and net refrigerating effect, and are based on an average evaporating temperature of -18°C (0°F). However, they may be used for any evaporator temperature from -40°C to 4°C (-40°F to 40°F) since the variation in the actual factors across this range is insignificant.

Correction Factor (CF) Liquid Temperature Entering TXV

Refrigerant	-18°C (0°F)	-12°C (10°F)	-7°C (20°F)	-1°C (30°F)	4°C (40°F)	10°C (50°F)	16°C (60°F)	21°C (70°F)	27°C (80°F)	30°C (86°C)	32°C (90°F)	38°C (100°F)
717	1.27	1.24	1.20	1.17	1.14	1.11	1.08	1.05	1.02	1.00	0.99	0.96

EXAMPLE:

At -29°C (-20°F) evaporator, 11 bar (160 psi) pressure drop and 10°C (50°F) liquid temperature, the capacity of an LMC-DA-10 (for ammonia) is:

$$44.3 \text{ bar} \times 1.11 = 49.2 \text{ bar}$$

$$(12.6 \text{ tons} \times 1.11 = 14.0 \text{ tons})$$

Sight Glass (SA K87 & SA K90)

Designed to be closed coupled with TXV valves the SA series sight glass offers a sight glass with flange connections for use on ammonia systems. By using the sight glass, one can be assured that solid liquid enters the thermostatic expansion valve. The sight glass can be used to diagnose system problems, and thus eliminate flash gas in the liquid entering the TXV.

These sight glasses are specifically designed for ammonia system use. The glass is fused into a steel body, which is then cadmium plated. Two sizes of flange connections permit attaching the sight glass into the system conveniently. The smaller flange size will mate with R/S type DA thermostatic expansion valve and XD-074 strainer. The larger size will mate with Type AA thermostatic expansion valve and 8006 strainer. The mating flanges, gaskets, and bolts should be ordered separately. The bolt length varies according to the assembly being made.

During installation of the sight glass, tighten the bolts carefully and uniformly to avoid putting an undue strain on the glass. The plating gives these products initial corrosion resistance. However, for long term use in an ammonia plant, they should be painted to obtain further corrosion protection.

Specifications

Maximum Rated Pressure (MRP) 34.5 barg (500 psig)

General Information

Sight Glass	Flange Groove OD x ID	Used With R/S Part Number		Bolt Length (inches)	Bolt Diameter (inches)	Dimensions (Inches)		Net Weight (lbs)
		TXV	Flange (inches)			Height	Length	
SA K87	1 1/8 x 3/4	DA	1/4, 3/8, or 1/2 FPT	3	7/16	1.87	1.36	0.75
SA K90	1 3/4 x 1 1/4	AA	1/2, 3/4, or 1 FPT	5	1/2	2.25	1.88	1.50

1 Flanges are supplied with TXV. Flanges can be ordered as part kits.

2 One gasket is supplied with sight glass. Gaskets can be ordered separately.

Constant Pressure Expansion Valve (PDA)

The PDA-1-0/80 constant pressure or automatic expansion valve is a downstream pressure regulating device that is applicable on ammonia (R-717) systems. The valve regulates the mass flow rate of refrigerant to maintain downstream pressure at a constant value. The normal application of this valve is to feed liquid refrigerant to an evaporator with a relatively constant heat load. However, the PDA-1-0/80 can be used to maintain a constant downstream pressure on other applications as well.

Specifications

The PDA-1-0/80 embodies the same design and construction details as the type D thermostatic expansion valve. However, the valve utilizes an element with an adjustable spring assembly in place of the thermostatic element. Also, a non-adjustable bottom cap replaces the external superheat adjustment. The adjustment range is 0 to 80 psig with a standard setting of 60 psig.

PDA

General Information

A4 Adaptomode® Schematic Flow Diagrams

Low Pressure Drop Option (LPD)

With the conventional evaporator regulator, a minimum of 0.14 bar (2 psi) pressure across the main valve is required for the valve to be fully open. The Low Pressure Drop feature added to a Type A4 inlet or outlet pressure regulator permits full flow modulation with pressure drops down to 0.04 bar (½ psi).

The principle of operation for the LPD is to provide high pressure refrigerant to the A2BOP pilot inlet line. Reduce this high pressure to a lower pressure and control it to follow the main regulator upstream pressure always at a fixed differential, approximately 0.35 bar (5 psi). Use this controlled following pressure through the pilot

circuit and to the top of the piston, where it will operate the main valve independently of the main line pressure drop. The controlled following pressure from the A2BOP must be enough higher than the upstream pressure to provide reliable operation at all times, but not so high at any time as to cause excessive leakage, which would reduce evaporator capacity.

All Type A4 Regulating Valves arranged for LPD operation must also be sized for LPD operation. The capacity of a regulator at 0.04 bar (½ psi) pressure drop will be 50% of the capacity at 0.14 bar (2 psi) pressure drop for the same inlet conditions.

Flow Diagram: A4_ Low Pressure Drop (LPD) Inlet Dual Pressure Regulator

The basic LPD assembly includes:

- Compensated pressure regulator (A2BOP)
- Gauge valves: 2 with inlet regulator, 3 with outlet regulator
- 760mm Hg to 10.5 bar (30" Hg to 150 lb.) gauges: 2 with inlet regulator, 3 with outlet regulator

Note: Not available with Variations E, L, K or R.

Suggested Flange Tightening Instructions for Manufacturer's Instructions

Verify that piping into which a valve or flange is to be installed is properly supported and aligned. Be certain that the mating surfaces of the gasketed joints are parallel, aligned and perpendicular to the pipe axis, in good condition and free of debris and corrosion. Use only undamaged gaskets suitable for service in an ammonia refrigerating system. Verify that all the nuts, bolts, cap screws and washers meet Parker's requirements for the application and tighten progressively in a diametrically staggered pattern. Leak test upon completing the installation.

For more information please reference the IAR 2-2008 Section 10.

Safety Guide

Selecting and Using Parker Products and Related Accessories

⚠ WARNING: FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF REFRIGERATING SPECIALTIES DIVISION PRODUCTS, ASSEMBLIES OR RELATED ITEMS (“PRODUCTS”) CAN CAUSE DEATH, PERSONAL INJURY, AND PROPERTY DAMAGE. POSSIBLE CONSEQUENCES OF FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF THESE PRODUCTS INCLUDE BUT ARE NOT LIMITED TO:

- Injuries or damage resulting from inhalation or exposure to conveyed fluids
- Injuries from lifting or supporting a heavy item
- Electric shock from contact with live electrically energized components
- Explosion

Before selecting or using any of these Products, it is important that you read and follow the instructions below.

1.0 General Instructions

- 1.1. Scope: This safety guide is designed to cover general guidelines on the installation, use, and maintenance of Refrigerating Specialties Division products (R/S Products).
- 1.2. Fail-Safe: R/S Products can and do fail without warning for many reasons. Design all systems and equipment in a fail-safe mode, so that failure of these products and related accessories will not endanger persons or property.
- 1.3. Distribution: Provide a copy of this safety guide to each person that is responsible for selection, installation, or use of R/S Products. Do not select or use R/S Products without thoroughly reading and understanding this safety guide as well as the specific R/S publications for the products considered or selected.
- 1.4. User Responsibility: Due to the wide variety of operating conditions and applications for R/S Products, Parker and its distributors do not represent or warrant that any particular R/S Product is suitable for any specific end use system. This safety guide does not analyze all technical parameters that must be considered in selecting a product. The user, through its own analysis and testing, is solely responsible for:
 - Making the final selection of the appropriate R/S Product.
 - Assuring that all user’s performance, endurance, maintenance, safety, and warning requirements are met and that the application presents no health or safety hazards.
 - Complying with all existing warning labels and / or providing all appropriate health and safety warnings on the equipment on which the R/S Products are used; and,
 - Assuring compliance with all applicable government and industry standards.
- 1.5. Safety Devices: Safety devices should not be removed or defeated.
- 1.6. Warning Labels: Warning labels should not be removed, painted over or otherwise obscured.
- 1.7. Additional Questions and Information: If you have any additional questions or require further information call 1-708-681-6300 or go to www.parker.com/refspec. Safety Bulletins RSBCV and RSBHV can also be obtained there.

2.0 Product Selection Instructions

- 2.1. Pressure rating: Never exceed the maximum rated pressure sometimes referred to as the design pressure of a refrigeration system. Consult product labeling, R/S catalogs or the instruction sheets supplied with R/S Products for maximum rated pressure.
- 2.2. Temperature rating: Never operate outside the rated temperature limits of an R/S Product. Operating the R/S Product outside the rated temperature limits can result in product failure. Consult R/S Product labeling, R/S catalogs, or the instruction sheets supplied with the R/S Products for maximum and minimum fluid temperature limits
- 2.3. Flow Rate: The flow rate requirements are a primary consideration when designing a refrigeration system. System components need to be able to reliably provide minimum and maximum flow requirements for the desired application. Flow ratings are provided in the R/S catalog.
- 2.4. Environment: Many environmental conditions can affect the integrity and suitability of a product for a given application. R/S Products are designed for use in general purpose industrial applications. Typical refrigerants used with these products are explosive, corrosive, caustic, or greenhouse gases. Compliance with government, industry or environmental standards is required.
- 2.5. Fluid Compatibility: Compatibility references can be found in R/S catalogs or calling 1-708-681-6300 or going to www.parker.com/refspec for any additional questions or information.

3.0 Product Assembly and Installation Instructions

- 3.1. Component Inspection: Prior to assembly or installation a careful examination of these R/S Products must be performed. All R/S Products must be checked for correct style, size, and catalog number. DO NOT use any R/S Product that displays any signs of nonconformance.

Safety Guide

Selecting and Using Parker Products and Related Accessories - Continued

- 3.2. Hydrostatic Expansion: Hydrostatic expansion (thermal expansion due to heating of liquids in a confined space) of liquid refrigerant trapped between refrigeration components can create dangerously high pressures and rupture components. See R/S Product bulletins and installation instructions for more detail on precautions to take to avoid damage or injury.
- 3.3. Installation Instructions: R/S published installation instructions must be followed for installation of R/S Products. These instructions are provided with every R/S Product sold, or by calling 1-800-627-4593, or at www.parker.com/refspec.

4.0 Valve and Accessory Maintenance and Replacement Instructions

- 4.1. Maintenance: R/S Product service life may be significantly reduced without a continuing maintenance program. The severity of the application, risk potential from a component failure, and experience with any known failures in the application or in similar applications should determine the frequency of inspections and the servicing or replacement of R/S Products so that they are replaced before any failure occurs. A maintenance program must be established and followed by the user and, at minimum, must include instructions 4.2 through 4.6.
- 4.2. Installation and Service Instructions: Before attempting to service or replace any worn or damaged parts consult the appropriate Service Bulletin for the R/S Product in question. These service and installation instructions are provided with every R/S Product sold, or are available by calling 1-800-627-4593, or at www.parker.com/refspec.
- 4.3. System Isolation Hazards: Care must be taken when isolating system components for service or replacement. As a guide see the appropriate bulletins published by the International Institute of Ammonia Refrigeration available at www.iiar.org. Also see R/S Safety Bulletins RSBCV and RSBHV available at www.parker.com/refspec for guidelines to avoid potentially dangerous conditions.
- 4.4. Visual Inspection: Any of the following conditions requires immediate system shut down, replacement of worn or damaged components, or correction of any system malfunction. These conditions can mask potentially hazardous situations and should be corrected.
 - Leakage to the atmosphere: Look and listen to see if there are any signs of damage to any of the components in the system.
 - Damaged or degraded components: Look to see if there are any visible signs of wear, component degradation or excessive corrosion.
 - Any observed improper system or component function.
 - Excessive dirt and/or ice build-up.
- 4.5. Service or Replacement Intervals: It is the user's responsibility to establish appropriate service and/or replacement intervals. R/S Products do wear and can deteriorate over time. Environmental conditions can significantly accelerate this process. R/S Products need to be serviced or replaced on routine intervals. Service intervals need to be established based on:
 - Previous performance experiences.
 - Government and/or industrial standards.
 - When failures could result in unacceptable down time, equipment damage or personal injury risk.
- 4.6. Servicing or replacing any worn or damaged parts: To avoid unpredictable system behavior that can cause death, personal injury and property damage:
 - Follow all government, state and local safety and servicing practices prior to service including but not limited to all OSHA Lockout Tagout procedures (OSHA Standard – 29 CFR, Part 1910.147, Appendix A, The Control of Hazardous Energy – Lockout / Tagout).
 - Disconnect electrical supply (when necessary) before installation, servicing, or conversion.
 - Components installed in pressurized refrigerant piping must be isolated from the refrigeration system and the refrigerant safely purged from the component. See 4.3 above.
 - Installation, servicing, and / or conversion of these products must be performed by knowledgeable and qualified personnel.
 - After installation or servicing electrical supplies (when necessary) should be connected and the product tested for proper function and leakage. If leakage is present or if the product does not operate properly, do not put the product or system into use.
 - Warnings and specifications on the product should not be covered or painted over. If masking is not possible, contact your local representative for replacement labels.
 - Putting Serviced System Back into Operation: Follow the guidelines above and all relevant installation and maintenance instructions supplied with the R/S Product to insure proper function of the system.

Safety Procedures

Refrigeration Control Valves

Introduction

This bulletin is a summary of safety procedures for the proper selection, installation, use and maintenance of Refrigerating Specialties Division industrial refrigerant control valves. Additional free copies are available and should be distributed to all concerned personnel. This bulletin is intended to help you protect your personnel, product and plant. Because of space limitations, this bulletin must be supplemented by accepted and known industry safety practices and local code requirements.

Refrigerating Specialties Division control valves are designed and built to the highest standards of the refrigeration industry. However, for proper performance the valves must be correctly chosen, properly installed and periodically serviced. Because safe operation is of primary concern, this bulletin emphasizes suggestions for the safe installation and maintenance of Refrigerating Specialties Valves. Read this information carefully before installing a valve or working on one already installed; also, use it to review all previous installations.

All personnel working on valves must be qualified to work on refrigeration systems. Any person intending to service a valve should completely read this bulletin and the product bulletin describing the particular valve and its operation before any work begins. If there are any questions, contact Refrigerating Specialties before proceeding with the work.

Receiving and Unpacking

All control valves are packed for maximum protection. Unpack carefully. Flange bolts are packed in cotton bags and coils are packed loose. Check the carton to make sure all flanges and other items are unpacked and in agreement with the packing slip. Save the enclosed instructions for the installer and eventual user. Do not remove the protective covering from the inlet and outlet of the control valve until the valve is ready to be installed.

Caution: Do not, at any time, make any alteration or modifications to any Refrigerating Specialties Division valves or regulators without the express and written approval of this company. Threaded parts should not be subjected to excessive torque by use of an oversized wrench, wrench extension or by impacting the wrench handle. Where specified in the individual bulletin, observe the torque requirements for bolts, screws and other threaded parts. Contact the factory for torque values not furnished in current literature.

For extensive repairs on valves or regulators, especially those more than three years old, the valves or regulators should be returned to the factory for thorough inspection and rebuilding. Spare parts should be checked for corrosion before installation. In addition, part numbers should be checked against the latest assembly bulletin to be sure current parts are being used.

If a valve or regulator has failed under circumstances which caused, or could have caused, injury to personnel or damage to property, a replacement valve should not be installed until the reason for the previous failure is determined and corrected. Adequate protection should be taken to prevent both liquid shock and suction shock both upstream and downstream of the valve or regulator.

Liquid Expansion

In liquid lines, or lines that might contain substantial amounts of liquid refrigerant, certain precautions must be taken to avoid damage due to liquid expansion when a section of line is isolated by positive shut off valves. This condition may occur whenever the ambient temperature could be higher than the liquid temperature. This could even occur in a refrigerant or oil line other than a "liquid" line.

Temperature increase in a section with trapped liquid can cause extremely high pressures due to the expanding liquid and possibly rupture a gasket, pipe, or valve. When low temperature liquid lines are used, as in a liquid overfeed (recirculation) system, and the lines or control valves may be exposed to warm ambient conditions, particular care must be taken; liquid expansion can occur very rapidly.

Check Valves

Check valves must never be installed at the inlet of either a solenoid valve, a regulator or a regulator with an electric solenoid pilot shut-off feature. Also, the check valve should not be installed at the inlet of an outlet pressure regulator in a system where liquid may be trapped between the two valves. If a check valve is needed, install it on the outlet side of such valves. Most solenoid valves and regulators will permit reverse flow if the outlet pressure is greater than inlet pressure. If at any time, such reverse pressure conditions are possible and reverse flow is unacceptable a check valve should be installed at the control valve outlet.

All hand valves that could trap liquid when closed must be marked with a warning against accidental closing. The liquid refrigerant must be removed before the hand valves are closed on both sides of a control valve or any other component. Also, liquid must be removed before a hand valve is closed at the inlet of a solenoid valve or a regulator with positive electric shut-off, or some outlet pressure regulators, or at the outlet of a check valve, unless these valves are manually open.

Caution: To protect personnel, product and plant, remove all liquid from the section to be isolated before hand valves are closed. Make sure the control valves are open when removing the liquid. See Service and Maintenance Instructions before attempting to take any valve apart.

Relief Devices

Relief devices or relief methods should be used in all parts of a refrigeration system where liquid can be trapped and liquid expansion could take

Safety Procedures

Refrigeration Control Valves - Continued

place. Under no circumstances should R/S Pressure Regulators be used as a relief to the atmosphere, R/S Type H Safety Relief valves should be used instead.

Selection and Application

A control valve must be selected only by a person having adequate knowledge of the system and of the valve to be chosen. Any Refrigerating Specialties Division control valve must be used only as specifically stated in Refrigerating Specialties Division Catalogs or Bulletins for normal refrigeration applications unless otherwise approved in writing by Refrigerating Specialties Division.

The valves are designed to operate with ammonia and/or halocarbon refrigerants. Valves using flanges with copper connections must not be used with ammonia refrigerant. Unless authorized by the factory, Refrigerating Specialties valves should not be used for refrigerants or fluids not mentioned on the nameplate or in the pertinent bulletin.

Installation

Installation must be done according to all applicable Safety Codes and Standards, and by personnel qualified to install refrigeration systems. Refrigerating Specialties Division control valves must be installed according to the manufacturer's instructions, this bulletin, and the generally known safety practices.

Mounting

ASTM A307 Grade A square headed bolts should be used to mount flanged body valves. They assure the maximum bolt surface and flange engagement. For all lug mounted valves, flange bolts should be inserted in a direction pointing toward the valve body. The bolt should pass first through the mounting flange before engaging the valve flange. Allow proper space for installing the valve. Do not use the valve to "stretch" or "align" the pipe. Using flange bolts to close a large gap can distort the valve or at least stress it unduly, and possibly cause it to malfunction, or the bolts may be damaged or stripped. (See table below for proper torque requirements). For proper sealing the gaskets should be lightly oiled and all bolts must be tightened evenly. Make sure the flange tongues are properly aligned with the grooves in the valve body. Where necessary, support the valve by brackets or hangers to avoid overstressing the pipe or valve.

When mounting weld-end valves: welding procedures for all steel pipe and fitting need to conform to all requirements of the ASME IX and other Pressure Pipe welding standards. In all cases where valves are installed without disassembly, they should be manually opened.

Location

Valves must not be installed in locations where they can be damaged by material handling or other equipment. Control valves should be installed such that the inlet pipe is straight for a minimum of 6 pipe diameters. Trapped ice build-up must be avoided at or between valves and other equipment. Provide reasonable access to all control valves for maintenance purposes.

Insulation

When it is necessary to insulate the control valves, the insulation must be applied to allow access for proper operation and maintenance of the valves. The manual opening and adjusting stems should be easily accessible at all times. In the case of solenoid valves the insulation must not extend to the coil housing or coil burnout may occur. Insulation should be constructed so that sections can be easily removed and replaced to allow the valve to be disassembled. Insulation applied to strainers should provide ready access for cleaning the strainer basket.

Since most maintenance problems caused by dirt occur at the start-up of a system, it is advisable to delay insulating the control valves and strainers until the system has operated for several days. During that time the strainers should be checked for dirt and cleaned as necessary. Cotton bags are available for 25mm - 100mm (1" - 4") Type RSF Strainers to improve their ability to remove small particles of dirt during start-up.

Pump Out Means

Individual valves or control stations should be provided with means for pumping out or safely purging the refrigerant.

Pressure Testing

Every segment of a refrigeration system, including control valves, should be field pressure tested before system is insulated and put in use. Make sure that correct high and low side test pressures are used. Use proper refrigerant or gas for pressure testing; that is do not use halocarbons or CO₂ to test an ammonia system, nor use ammonia to test halocarbon system. Never use the compressor in a system to build up pressure for testing.

In pressure testing Range V, VA, A, B or D pressure regulators, test pressure in excess of 21. kg/cm² (300 psig) may cause setting shift and diaphragm may deform enough to require replacement after the test. If the above conditions exist, contact the factory for proper solution.

Electrical

Only properly qualified electricians should handle the electrical portions of control valves and their circuitry. All power supplies

Safety Procedures

Refrigeration Control Valves - Continued

and wiring must be adequate to provide the proper voltage and current to the solenoid coils. The power supply must be capable of providing the proper in-rush current. Never energize the solenoid with the coil housing or plunger assembly removed.

Service and Maintenance

All systems require maintenance and service. The personnel doing the work must be qualified and completely familiar with the system they are to work on or all other precautions will be meaningless.

Pump Out

For the protection of personnel, product, and plant, all refrigerant possible must be removed from a valve or any other component of the system, before any refrigerant retaining part is loosened. Before opening a valve, make sure all refrigerant liquid has been removed. In particular, beware of strainers and other sections of piping which may trap liquid refrigerant which will require a considerable length of time to remove. Pump out as much refrigerant as possible before discharging remaining refrigerant in a properly protected manner. During pump out make sure control valves are opened manually to avoid trapping refrigerant. All type RSF and RSW Strainers are provided with 3/8" FPT connection to assist in pump out.

At times it may be necessary to discharge some small amount of refrigerant from the isolated section. When this becomes necessary, certain precautions must be observed. Make sure control of discharge rate can be easily maintained and that a quick shut-off is available.

Refrigerant should be discharged into and disposed of in a proper container accepted by applicable safety codes and standards. Discharge of refrigerant to atmosphere should be avoided. Never discharge any refrigerant into an area without sufficient ventilation, or into an area where open flame or electrical spark is present. Any oil in the refrigerant may cause a mist that could cause a fire or explosion. Halocarbon refrigerant should not be discharged into areas where open flame is present, since toxic gases may form. Ammonia should not be discharged into occupied areas, or areas containing product affected by ammonia. In the case of ammonia, discharge any vapor left into a container of cold water, making sure that the discharge hose remains submerged at all times. (Be sure that no pressure reversals can occur that may pull water into the system.) Water may have to be refreshed to absorb all the ammonia; about one gallon of fresh water is needed for one pound of ammonia. To prevent pulling excessive air and moisture into a system, avoid opening the system when it is under vacuum.

Caution: Do not attempt to work on any part of a refrigeration system without having help nearby and observing. Use safety glasses or a safety face shield for added safety to protect the eyes. Protective equipment should be readily available and all personnel involved should be thoroughly trained in its use. Personnel should be especially protected against falling because they may be startled by escaping refrigerant. Always make sure that there is a way out and that everyone can leave the area fast. When seal caps cover manual opening or adjusting stems, the caps must be removed with caution because liquid refrigerant could accumulate under such a cap. Avoid contact with any liquid refrigerant.

Electrical

Before working on any valve or other item having electrical components refer to the "ELECTRICAL" paragraph of the "INSTALLATION" section. Be sure the circuits are completely de-energized; just throwing a switch may not be sufficient. Failure to do this may result in personal injury or damage to solenoid coils or other components. Take care to see that the circuits cannot be energized accidentally. Never energize the solenoid with the coil housing or plunger assembly removed.

Disassembly

Be sure that any person working on a valve is familiar with its construction and operation by referring to the proper bulletin. Make sure the pressure in the system to be opened is reduced to, and remains, at atmospheric pressure before valve pressure containment seals are released. A pressure gauge should be connected to the part of the system to be evacuated. Before removing the bonnet of pressure regulators, back out adjusting stem to prevent damage to the diaphragm.

Re-assembly

Be sure all parts are clean and free of moisture before reassembly. Damaged parts and gaskets should be replaced. It is advisable to purge the section of air before opening it to the rest of the system. When opening hand valves, ensure that initial refrigerant flow will be in the normal direction of valve flow; this will avoid backflow and possible damage to the strainer if one is used.

Dirt, Contamination, and Corrosion

Protect the valves from foreign material during storage and installation. The protective plugs on the valve openings should remain in place until the valves are ready to be installed. Once a section of a system is installed, and before it is put into operation, it is advisable to charge it with appropriate refrigerant or suitable inert gas to avoid corrosion. Avoid exposure of R/S valves to halogenated solvents or similar reactive fluids. External corrosion over a long period of time must be controlled by painting and replacement of corroded parts.

Strainer Maintenance

Strainer inspection is of utmost importance, especially the first few hours, days or weeks after the start-up. Foreign material should be removed and the screens should be washed with proper solvent. Strainer inspection and cleaning should be continued until dirt accumulation ceases. Later, any time a valve pressure containment seal is released for service or maintenance, its companion strainer should also be inspected and

Safety Procedures

Refrigeration Control Valves - Continued

cleaned. Filter bags are available for 25mm - 100mm (1" - 4") Type RSF Strainers to improve their ability to remove small particles of dirt during start-up. If a strainer filter bag is used in the strainer basket, the cloth bag must be checked every few days depending upon the amount of system dirt collected. When the cloth bag no longer collects dirt, it must be discarded.

General Specifications

Refrigerating Specialties refrigerant containing valves and strainers are designed for a Maximum Rated Pressure of 21 bar (300 psig) except where shown otherwise on the nameplate. They are suitable for use under most temperature conditions encountered in refrigeration systems. If either fluid or ambient temperature is below a valves rated minimum, consult the factory. In addition, should fluid temperature exceed the rated maximum or should ambient temperatures exceed 125° F., consult the factory.

Safety Procedures

Refrigeration Hand Shut-Off Valves

Introduction

This bulletin is a summary of safety procedures for the proper installation, use and maintenance of Refrigerating Specialties Division industrial refrigerant valves. Additional free copies are available and should be distributed to all concerned personnel. This bulletin is intended to help you protect your personnel, product and plant. Because of space limitations, this bulletin must be supplemented by accepted and known industry safety practices and local code requirements.

Refrigerating Specialties Division hand valves are designed and built to the highest standards of the refrigeration industry. However, for proper performance, the valves must be properly installed and maintained. Because safe operation is of primary concern, this bulletin emphasizes suggestions for the safe installation and maintenance of Refrigerating Specialties Valves. Read this information carefully before installing a valve or working on one already installed. It should also be used to review all previous installations.

All personnel working on valves must be qualified to work on refrigeration systems. Any person intending to service a valve should completely read this bulletin and the product bulletin describing the particular valve and its application and disposition before any work begins. If there are any questions, contact Refrigerating Specialties before proceeding with the work.

Receiving and Unpacking

All valves are packed for maximum protection. Unpack carefully. Check the carton to make sure all items are unpacked and in agreement with the packing slip. Save the enclosed instructions for the installer and eventual user. Do not remove the protective covering from the inlet and outlet of the valve until the valve is ready to be installed.

Caution: Do not, at any time, make any alteration or modifications to any Refrigerating Specialties Division valves without the express and written approval of this company. Threaded parts should not be subjected to excessive torque by use of an oversized wrench, wrench extension, or by impacting the wrench handle. Where specified in the individual bulletin, observe the torque requirements for bolts, screws and other threaded parts. Contact the factory for torque values not furnished in current literature.

Spare parts should be checked for corrosion before installation. In addition, part numbers should be checked against the latest assembly bulletin to be sure current parts are being used.

If a valve has failed under circumstances which caused, or could have caused, injury to personnel or damage to property, a replacement valve should not be installed until the reason for the previous failure is determined and corrected.

Liquid Expansion

In liquid lines or lines that might contain substantial amounts of liquid refrigerant, certain precautions must be taken to avoid damage due to liquid expansion when a section of line is isolated by positive shut off valves. This condition may occur whenever the ambient temperature could be higher than the fluid temperature. This could even occur in a refrigerant or oil line other than a "liquid" line.

Temperature increase in a section with trapped liquid can cause extremely high pressures due to the expanding liquid and possibly rupture a gasket, pipe, or valve. When low temperature liquid lines are used, as in a liquid overfeed (recirculation) system, and the lines may be exposed to warm ambient conditions, particular care must be taken. It should be noted that liquid expansion can occur very rapidly in a line.

Hand Valves

All hand valves that could trap liquid when closed must be marked with a warning against accidental closing. The liquid refrigerant must be removed before the hand valves are closed on both sides of a control valve or any other component. Also, liquid must be removed before a hand valve is closed at the inlet of a solenoid valve or a regulator with positive electric shut-off, or some outlet pressure regulators, or at the outlet of a check valve, unless these valves are manually open.

Caution: To protect personnel, product and plant, remove all liquid from the section to be isolated before hand valves are closed. Make sure the control valves are open when removing the liquid. See Service and Maintenance Instructions before attempting to take any valve apart.

Hand Valve Installation Requirements

Installation must be done according to all applicable Safety Codes and Standards, and by personnel qualified to install refrigeration systems. Refrigeration Specialties Division valves must be installed according to the manufacturer's instructions, this bulletin, and the generally known safety practices in the industry.

Hand Valves should be installed such that seal caps, opening stems or hand wheels are accessible, that stem movement remains unrestricted, and with sufficient surrounding clearances that the incorporation into the pipeline is unchallenged. For the FPT-connected valves, this means full rotation of the valve plus sufficient clearance to permit a wrench to engage the hexagonal portions of the valve body for tightening to the desired orientation.

Welding procedures for all steel pipe and fittings need to conform to all requirements of the ASME (Section B31.5 and IX), API, and other applicable piping codes.

Safety Procedures

Refrigeration Hand Shut-Off Valves - Continued

R/S recommends against the use of compressed air for leak testing. While many successful installations have employed compressed air, the effects of moisture and oxygen, both short and long term, on system interior condition, integrity, and performance are too significant to make it preferable to a dry nitrogen test. It has been established by investigation of failure modes, that certain chemicals will infiltrate the discontinuities in a chilled weld and reside there, setting up corrosion products. Oxygen entrapped in such notch sites, combined with the presence of ammonia, will promote stress corrosion cracking in a relatively short period. R/S recommends that leak testing be applied with dry nitrogen and that the elevated pressure be reduced to near-atmospheric only shortly before the evacuation process is started. The segment should subsequently be evacuated to no more than 750 Micron and the refrigerant then be introduced promptly to a pressure well above atmospheric. Repeated cycles of breaking the vacuum with Dry Nitrogen and re-establishing it, is highly recommended.

R/S's Hand Valve offerings incorporate high-temperature Carbon Extended PTFE as seat disc. This material has a stability temperature over 420 °F. and therefore, under most circumstances, permits the installer to weld a valve into the pipeline without first removing the bonnet. Removing pipe debris and the spatter consequence of the welding becomes more difficult when installing a valve in this way, so the incorporation of backing rings or the employment of socket weld valves is encouraged. Even with that, installation processes and procedures need to address the intent to remove all possible debris from the piping section.

In all cases where valves are installed without disassembly, the Valve disc should be in a mid stroke position while welding. This precludes contact and limits the heat conducted from the body to the seat ring on the disc and avoids any arcs between the beveled seat of the body and the disc assembly. Actual body temperatures achieved during welding cannot be predicted precisely because they vary with welding current and technique, length of adjacent piping, the sequence in which joints are made, the energy input from any adjacent components, the application and flow of any purging gas, and so on. In the absence of a cooling purge gas stream, R/S recommends that the bonnet be removed from a valve should the length of pipe to be connected to the valve be less than 5-times the pipe diameter. All such temperature profiles change considerably should either side of the adjacent piping be insulated or otherwise restrained from freely conducting away the heat from welding.

The potential for interference with material and components yet to be installed such as insulation, electrical equipment, and structural additions for maintenance access or equipment protection, need to be considered. The completed construction overall should be arranged to preclude the potential for contact with moving part machinery, material handling equipment, and similar conditions. Valves on cold lines will often accumulate frost and /or drip moisture. The location and orientation of service valves should consider all these potential conditions.

Stem Seal Design

Along with the temperature tolerant Seal Ring material, R/S's Hand Valves are furnished with Dual O-Ring Stem Seals. This arrangement minimizes frictional force on the stem, and rotational torque is very low. Combined with the wiping and forming action of the conical seat bead, the overall result is a very low hand wheel or actuator force required for complete sealing. This also reduces the effect of creep or shrink. In most cases, this precludes any need to retighten the valve.

A packing on the wetted side of the O-Ring Gland wipes the stem free of dirt or debris from the system side. It also provides a final safety margin such that should the O-Rings be contaminated in any fashion, the packing nut can be tightened down to engage this packing and renew the stem seal. This results in a valve that requires considerably different user inputs to actuate particularly as compared to other valves remaining entirely intact, and should not be considered an acceptable long-term condition. Repair and renewal should be affected as soon as possible.

Whether specified with the Hand Wheel or Seal Cap arrangement, the torque required to seat the valve is minimal and should never be applied in excess of the maximum values listed in the attached table. Back seating torque is also minimized by employing a knife edge against a beveled portion of the stem; the diameter of the seat is just greater than that of the stem threads, which prevents extraction of the stem even in the case of mechanical failure.

Mounting

Allow proper space for installing the valve. Where necessary, support the valves by brackets or hangers to avoid overstressing the pipe or valve.

Location

Valves must not be installed in locations where they can be damaged by material handling or other equipment. Trapped ice build-up must be avoided at or between valves and other equipment. Provide reasonable access to all control valves for maintenance purposes.

Insulation

When it is necessary to insulate the valves, the insulation must be applied to allow proper operation and maintenance of the valves. The actuator stems should be easily accessible at all times. Insulation should be constructed so that sections can be easily removed and replaced to allow the valve to be disassembled. Since most maintenance problems caused by dirt occur at the start-up of a system, it is advisable to delay insulating the valves until the system has operated for several days.

Pump Out Means

Individual valves or control stations should be provided with means for pumping out or safely purging the refrigerant.

Safety Procedures

Refrigeration Hand Shut-Off Valves - Continued

Dirt and Corrosion

Protect the valves from foreign material during storage and installation. The protective plugs on the valve openings should remain in place until the valves are ready to be installed. Once a section of a system is installed, and before it is put into operation, it is advisable to charge it with proper refrigerant or suitable inert gas to avoid corrosion. External corrosion over a long period of time must be controlled by painting and replacement of corroded parts.

Pressure Testing

Every segment of a refrigeration system should be field pressure tested before the system is insulated and put in use. Make sure that correct high and low side test pressures are used. Use proper refrigerant or gas for pressure testing; that is do not use halocarbons or CO₂ to test an ammonia system, nor use ammonia to test halocarbon system. Never use the compressor in a system to build up pressure for testing.

Service and Maintenance

All systems require maintenance and service. The personnel doing the work must be qualified and completely familiar with the system they are working on or all other precautions will be meaningless.

Caution: Do not attempt to work on any part of a refrigeration system without having help nearby and observing. Use safety glasses or a safety face shield to protect the eyes. Protective equipment should be readily available and all personnel involved should be thoroughly trained in its use. Personnel should be especially protected against falling because they may be startled by escaping refrigerant. Always make sure that there is a way out and that everyone can leave the area fast. When seal caps cover manual opening or adjusting stems, the caps must be removed with caution because liquid refrigerant could accumulate under such a cap. Avoid contact with any liquid refrigerant.

Pump Out

For the protection of personnel, product, and plant, all refrigerant possible must be removed from a valve or any other component of the system, before any refrigerant retaining part is loosened. Before opening a valve, make sure all refrigerant liquid has been removed. In particular, beware of strainers and other sections of piping which may trap liquid refrigerant which will require a considerable length of time to remove. Pump out as much refrigerant as possible before discharging remaining refrigerant in a properly protected manner. During pump out, make sure control valves are opened manually to avoid trapping refrigerant. All type RSF and RSW Strainers are provided with 3/8" FPT connection to assist in pump out.

At times, it may be necessary to discharge some small amount of refrigerant from the isolated section. When this becomes necessary, certain precautions must be observed. Make sure control of discharge rate can be easily maintained and that a quick shut-off is available.

Refrigerant should be discharged into and disposed of in a proper container accepted by applicable safety codes and standards. Discharge of refrigerant to atmosphere should be avoided. Never discharge any refrigerant into an area without sufficient ventilation, or into an area where open flame or electrical spark is present. Any oil in the refrigerant may cause a mist that could cause a fire or explosion.

Halocarbon refrigerant should not be discharged into areas where open flame is present, since toxic gases may form. Ammonia should not be discharged into occupied areas, or areas containing product affected by ammonia. In the case of ammonia, discharge any vapor left into a container of cold water, making sure that the discharge hose remains submerged at all times. (Be sure that no pressure reversals can occur that may pull water into the system.) Water may have to be changed to absorb all the ammonia; about one gallon of fresh water is needed for one pound of ammonia.

To prevent ingress of excessive air and moisture into a system, avoid opening the system when it is under vacuum.

Disassembly

Be sure that any person working on a valve is familiar with its construction and operation by referring to the proper bulletin. Make sure the pressure in the system to be opened is reduced to, and remains, at atmospheric pressure before opening the valve. A pressure gauge should be connected to the section of the system to be evacuated.

Re-Assembly

Be sure all parts are clean and free of moisture before re-assembly. Damaged parts and gaskets should be replaced. It is advisable to purge the section of air before opening it to the rest of the system. When opening hand valves, always open the valve to the inlet of the control valve first; this will avoid back flow and possible damage to the strainer if one is used.

General Specifications

Refrigerating Specialties refrigerant containing valves and strainers are designed for a Maximum Rated Pressure of 27.6 bar (400 psig) except where shown otherwise on the nameplate. They are suitable for use under most temperature conditions encountered in refrigeration systems. Maximum and minimum fluid temperatures for each valve are published in R/S Condensed Catalog CC I I c. If either fluid or ambient temperature is below a valve's rated minimum, consult the factory. In addition, should fluid temperature exceed the rated maximum or ambient temperatures exceed 125° F., please consult factory.

The valves are designed to operate with ammonia and/or halocarbon refrigerants. Unless authorized by the factory, Refrigerating Specialties valves should not be used for refrigerants or fluids not mentioned on the nameplate or in the pertinent bulletin.
